Table of contents

1. Summary of test results

Modifications made during testing
The equipment passes without specific or special attributes.

Deviations from the standard
No deviations were made from the requirements of the standard.

Final Verdict: PASS

FCC Rule	Industry Canada	Title	EUT set-up[1]	Result
§ 2.1046	RSS-133 §6.2	RF Output Power conducted	1	Complies
§ 2.1046 / § 24.232	RSS-133 §6.2	RF Output Power radiated, EIRP	2	Complies
§ 2.1049	--	Occupied bandwidth	1	Complies

2. Administrative Data

2.1. Identification of the testing laboratory

Company name:	CETECOM Certification and Testing in Communications GmbH
Address:	Im Teelbruch 122 D-45219 Essen - Kettwig Germany
Laboratory accreditation:	DAR-Registration No.: TTI-P-G081/94 FCC- Registration No.: 99538
Responsible for testing laboratory:	Dipl.-Ing. W. Richter
Deputies:	Dieter Franke Dipl.-Ing. Karin Silberhorn Dipl.-Ing. Heiko Strehlow

2.2. Test location

2.2.1. Test laboratory "CTC"

Company name:	see chapter 2.1. Identification of the testing laboratory

2.3. Organizational items

Reference No.:	20542043
Order No.:	--
Responsible for test report and project leader:	Dipl.-Ing. V. Krueger
Receipt of EUT:	2002-07-17
Date(s) of test:	2002-07-17 – 2002-08-01
Date of report:	2002-08-19
Number of report pages:	65
Number of diagram pages (annex):	no diagrams
Version of template: 4.05	

2.4. Applicant´s details

Applicant´s name:	Siemens AG
Address:	Siemensdamm 50 13629 Berlin Germany
Contact person:	Mr. Hussein Halawi; Tel. +49 30 38630211

2.5. Manufacturer´s details

Manufacturer´s name:	please see Applicant´s details
Address:	please see Applicant´s details

3. Equipment under test (EUT)

3.1. EUT: Type, S/N etc. and short descriptions used in this test report

short descrip-tion*)	EUT	Type	S/N serial number	HW hardware status	SW software status
EUT A	GPRS / GSM Module	MC 45	004999411378077	B 2.5	SW: 34
EUT B	Development support box	DSB 45	# 200	B 1.1	V 1.0
EUT C	Handset Votronic	HH-SI-30.3	Sample 2	V 1.1	--
EUT D					
EUT E					
EUT F					

*) EUT short description is used to simplify the identification of the EUT in this test report.

Additional Information for EUT A

Frequency range:	1850.2 – 1909.8 MHz	
Number of channels:	300	
Nominal power supply voltage:	4,5 V (of module)	
Power supply range:	3,3 – 4,5 V	
Temperature range:	-30°C - +60°C	
Emission designator:	300KGXW	
Antenna:	☐ integral antenna	☒ antenna connector ☒ external antenna
Max. stated nominal output power:	conducted 30,0 ±2 dBm,	radiated 30,0 ±2 dBm EIRP
Max. measured output power:	conducted 29,7 dBm,	radiated 30,6 dBm EIRP

3.2. Auxiliary Equipment (AE): Type, S/N etc. and short descriptions

AE short descrip-tion*)	Auxiliary Equipment	Type	S/N serial number	HW Hardware status	SW software status
AE 1	RS 232 cable 1	for Com1 - Port	--	Length=1.81 meter	--
AE 2	RS 232 cable 2	for Com2 - Port	--	Length=1.81 meter	--
AE 3	AC/DC Adapter	MW 1000 GS	Sample 2	Input: 230 V AC, 50 Hz, 28 W Output: 3-6V 9-12 V DC, 1000 mA, 12 VA	--
AE 4	GSM Antenna	900/ 1800 MHz	# 1	0 dB Gain length=1 meter	--

*) AE short description is used to simplify the identification of the auxiliary equipment in this test report.

3.3. EUT set-ups

EUT set-up no.*)	Combination of EUT and AE	Remarks
set. 1	EUT A + EUT B + EUT C + AE 1 + AE 2 + AE 3	Set-up for **conducted** measurements: MC 45 situated outside the DSB45 support-box com-1 cable and com-2 cable connected to DSB-Box but not terminated on the other side (open)
set. 2	EUT A + EUT B + EUT C + AE 1 + AE 2 + AE 3 + AE 4	Set-up for **radiated** measurements: MC 45 situated outside the DSB45 support-box com-1 cable and com-2 cable connected to DSB-Box but not terminated on the other side (open)
set. 3	--	--

*) EUT set-up no. is used to simplify the identification of the EUT set-up in this test report.

3.4. EUT operating modes

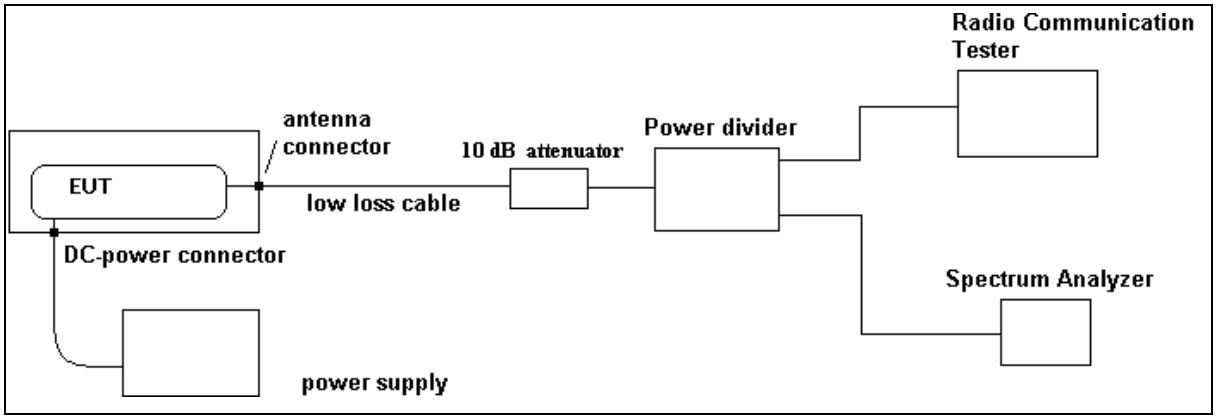
EUT operating mode no.*)	Description of operating modes	Additional information
op. 1	**IDLE**	The mobile station is synchronized at the Broadcast Control Channel (BCCH) and listening to the Common Control Channel (CCCH), for details please see chapter: 4.3. Parameter settings on mobile phone and CMU.
op. 2	**TCH**	A communication link is established between the mobile station and the test simulator. The transmitter is operated at its maximum rated output power, for details please see chapter: 4.3. Parameter settings on mobile phone and CMU.

*) EUT operating mode no. is used to simplify the test report.

4. Test Set-ups

4.1. Test Set-up 1 for Conducted measurements

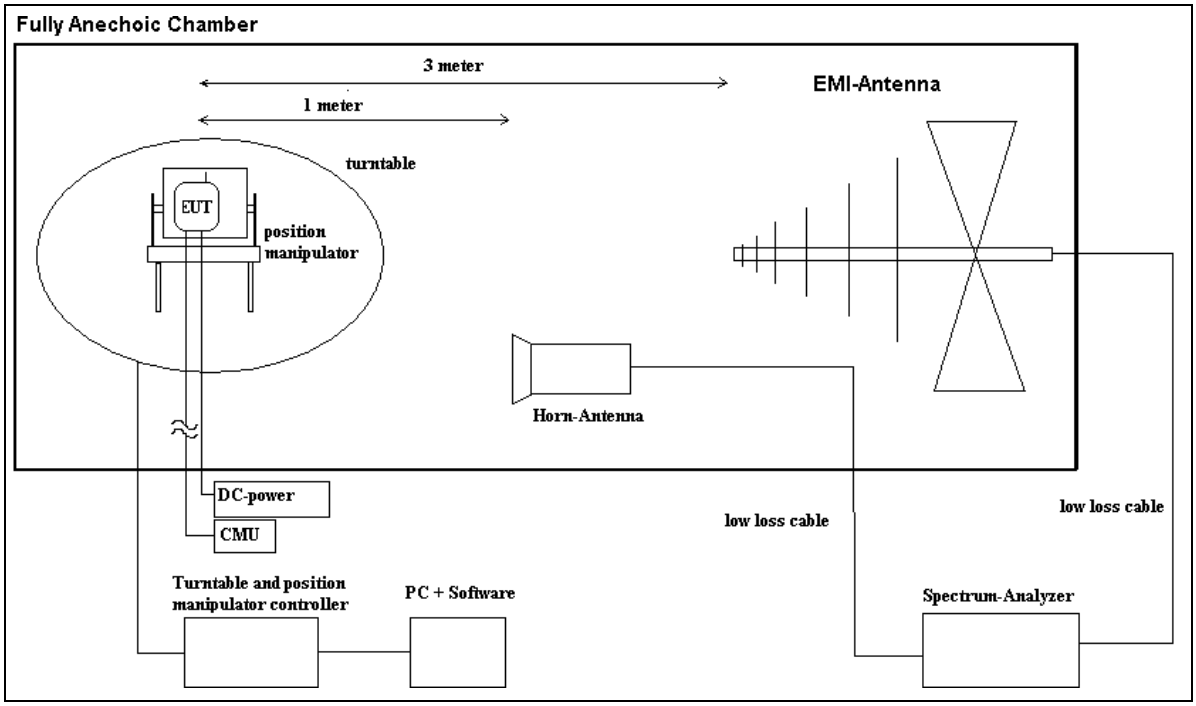
The EUT's RF-signal is coupled out by the antenna connector which is supplied by the manufacturer. The signal is first 10 dB attenuated before it is 0° power divided (6 dB loss per branch). One of the signal path is connected to the communication base station CMU, the other one is connected to the spectrum – analyzer. The specific losses for both signal paths are first checked within a calibration, then the measurement readings on the CMU/ spectrum-analyzer are corrected by this specific test set-up loss. The attenuator, power divider, CMU and the spectrum-analyzer are impedance matched on 50 Ohm.



Block diagram: Test set-up 1

4.2. Test Set-up 2 for Radiated measurements

The radiated emissions from the test device are performed in a fully anechoic chamber. The EUT is placed on a non-conducting table of 1 meter high. The turntable and the position manipulator are commanded by a external control unit, so adjusting to all three orthogonal planes of the EUT are possible in order to maximize the radiated emissions. The measurements are performed in vertical and horizontal receiving antenna polarizations. The measuring distances are 3 meter for frequencies up to 1 GHz and 1 meter above 1 GHz. A biconilog antenna up to 1 GHz and Horn antennas for frequencies above 1 GHz are used.
The EUT is powered by an external DC-supply with nominal voltage, the signaling is performed from outside the chamber with a communication tester (CMU) by airlink (using a signaling antenna).



Block diagram: Test set-up 2

4.3. Parameter settings on mobile phone and CMU

Following settings are general for all measurements:

Parameter	Traffic Mode	Idle Mode
Traffic Channels mobile station	TCH MS = 512 / 681 / 810	--
maximum power step (PCL)	PCL = 0 (1 Watt)	--
Modulation	GMSK-Modulation	--
DTX	off	--
Bitstream	PRBS 2E9-1 (pseudo-random-sequence) – CCITT 0.153	
Timeslot	3	
Hopping	off	
Timeslot (slot mode)	single	
Maximum data transmission rate, single time slot	270.833 kBit/s	
Speech transcoding (Traffic Mode)	Full rate Version 1	
Mode	BCCH and TCH	
BCCH – base station (CMU, CMD)	Channel 530	530
TCH – base station (CMD, CMU)	auto	
Power level TCH – base station (used timeslot level)	- 70 dBm	
Power level BCCH – base station (control channel level)	- 80 dBm	
Burst shot	Single	
Display Mode	Maximum	
Statistic counts	200	
RF-maximum level	36 dBm	
RF Input / Output connector No.	No. 3	
P/PCL	3 channels	
BS_AG_BLKS_RES	Not applicable	0
Paging re-organization		Off (0)
Signaling channel		SDCCH
Location Update		Auto
Cell access		Disabled (barred)

Settings for CMU

Additional settings for § 2.1055

Repetition	Continuous	
Stop condition	None	
Display mode	Max./Min	
Statistic Count	1000 Bursts	
Decoder	Standard	

5. Measurements

5.1. Calibration of anechoic chamber

A pre-calibration method was used for determining the relevant radiated field-strength of radiated spurious in the fully anechoic chamber.

Generally a measured value is influenced by the characteristics of the used cables, filters, antennas and by the characteristics of the anechoic chamber.
By defining a ***transducer*** (TD) value, which include all characteristics of the signal propagation path (used equipment, cables, properties of anechoic chamber, etc.) from the source of radiation to the final reading equipment (spectrum-analyzer), the measured value can be corrected in order to get the real value of the device under test.

The method resumes as follows:

1.) determination of the path-loss of all cables used on the Tx- and Rx-side, which are used for the radiated measurement in the specific set-up for 1 meter and 3 meter distance.
2.) connection of the cables to the relevant antennas used for calibration.
3.) determination of the ***space attenuation loss*** *(G)* in the anechoic-chamber for both horizontal and vertical antenna polarizations:

A signal generator connected to the Tx-antenna sweeps the frequency range of interest (30 MHz to 20 GHz) with a CW-signal level of –30dBm - the readings on the Rx-side on the spectrum analyzer gives the space attenuation loss. ***The distance between Rx- and Tx-antenna is 3 meter for frequencies below 1 GHz, and 1 meter for frequencies above 1 GHz.***

4.) From the ***space attenuation loss*** mathematically the frequency dependant transducer values ($TD_{H/V}$) can be evaluated:

$$TD_{H/V} = G_{H/V} + B_{H/V} - 10 \cdot \log_{10}(1.64) + D + E - F$$

ABREVIATIONS:

$TD_{H/V}$ = λ/2 transducer values horizontal / vertical
$G_{H/V}$ = space attenuation loss horiz./ vert.
$B_{H/V}$ = Gain of Tx-antenna -Dipole
$10*\mathrm{Log}_{10}(1.64)$ = Gain in dB of λ/2 Dipole relative to isotropic radiator
D = insertion losses of Rx- and Tx-cables
E = Loss of filters in signal path (not used for FCC measurements)
F = Gain of pre-amplifiers in signal path (not used for FCC measurements)

5.) Definition of transducer tables which are programmed/ loaded in the spectrum analyzer. The readings on the spectrum-analyzer are automatically corrected by this values and can be compared directly with the limit lines. The limit is related to EIRP. EIRP can be calculated from ERP by adding the gain of the half-wave dipole: EIRP = ERP + 2.1dBi

5.2. RF power output § 2.1046 conducted

5.2.1. Test equipment (for reference numbers please see chapter 'List of test equipment')

RF-equipment	Test site	Antenna	Spectrum Analyzer	GSM test system
249, 279	☒ radio lab	☐	☒ 264 (FSEK 30)	☒ 298 (CMU 200)
	☐ anechoic chamber	☐	☐ 120 (FSEM 30)	☐
	☐	☐	☐	☐

5.2.2. Test condition and test set-up

T = 22°C, h = 66%, p = 1015 hPa

(a) For transmitters other than single sideband, independent sideband and controlled carrier radiotelephone, power output shall be measured at the RF output terminals when the transmitter is adjusted in accordance with the tune-up procedure to give the values of current and voltage on the circuit elements specified in § 2.1033(c)(8). The electrical characteristics of the radio frequency load attached to the output terminals when this test is made shall be stated.

(b) For single sideband, independent sideband, and single channel, controlled carrier radiotelephone transmitters the procedure specified in paragraph (a) of this section shall be employed and, in addition, the transmitter shall be modulated during the test as follows. In all tests, the input level of the modulating signal shall be such as to develop rated peak envelope power or carrier power, as appropriate, for the transmitter.

(c) For measurements conducted pursuant to paragraphs (a) and (b) of this section, all calculations and methods used by the applicant for determining carrier power or peak envelope power, as appropriate, on the basis of measured power in the radio frequency load attached to the transmitter output terminals shall be shown. Under the test conditions specified, no components of the emission spectrum shall exceed the limits specified in the applicable rule parts as necessary for meeting occupied bandwidth or emission limitations.

1) The measurements were made at the upper, center, and lower carrier traffic frequencies of the PCS band. Choosing three representative Tx-carrier frequencies of the mobile phone (1850.2 MHz, 1880 MHz and 1909.8 MHz) should be sufficient to demonstrate compliance.
2) The measurements were performed with the integrated power measurement function of the „radio communication tester CMU“ from Rohde & Schwarz. In this way spectrum analyzer instrument limitations can be avoided/minimized. Instead, CMU‘s manufacturers calibration error can be assumed for this measurement.
3) The attenuations (insertion loss) at the RF Inputs/Outputs of CMU were set according the losses of the set-up, determined in a first step before starting the measurements. In this way the insertion loss is automatically considered for power readings.
4) The maximum power level of the GSM-Bursts were recorded: average and peak values

The configuration of the signaling unit is shown in chapter ‘Parameter settings on mobile phone’.

5.2.3. Results

The EUT is powered with nominal voltage.

EUT Type and S/N or EUT set-up no.	EUT set-up 1; op. 2 = TCH				
Channel:	Transducer factor [dB]	Average power [dBm]	Peak power [dBm]	Limit [dBm]	Verdict
512	16,2	29,5	29,6	30,0 ± 2dB	passed
661	16,2	29,4	29,5	30,0 ± 2dB	passed
810	16,5	29,5	29,7	30,0 ± 2dB	passed

5.3. RF power output § 2.1046 radiated

5.3.1. Test equipment (for reference numbers please see chapter 'List of test equipment')

RF-equipment	Test site	Antenna	Spectrum Analyser	GSM test system
	☐ radio lab	☒ 48 bicon.-log.	☒ 264 (FSEK 30)	☒ 298 (CMU 200)
	☒ anechoic chamber	☒ 133 horn	☐ 120 (FSEM 30)	☐
	☐	☒ 302 horn	☐	☐

5.3.2. Test condition and test set-up

T = 25°C, h = 65%, p = 1015 hPa

(a) For transmitters other than single sideband, independent sideband and controlled carrier radiotelephone, power output shall be measured at the RF output terminals when the transmitter is adjusted in accordance with the tune-up procedure to give the values of current and voltage on the circuit elements specified in § 2.1033(c)(8). The electrical characteristics of the radio frequency load attached to the output terminals when this test is made shall be stated.

(b) For single sideband, independent sideband, and single channel, controlled carrier radiotelephone transmitters the procedure specified in paragraph (a) of this section shall be employed and, in addition, the transmitter shall be modulated during the test as follows. In all tests, the input level of the modulating signal shall be such as to develop rated peak envelope power or carrier power, as appropriate, for the transmitter.

(c) For measurements conducted pursuant to paragraphs (a) and (b) of this section, all calculations and methods used by the applicant for determining carrier power or peak envelope power, as appropriate, on the basis of measured power in the radio frequency load attached to the transmitter output terminals shall be shown. Under the test conditions specified, no components of the emission spectrum shall exceed the limits specified in the applicable rule parts as necessary for meeting occupied bandwidth or emission limitations.

1.) The measurements were made at the upper, center, and lower carrier traffic frequencies of the PCS band. Choosing three representative Tx-carrier frequencies of the mobile phone (1850.2 MHz, 1880 MHz and 1909.8 MHz), should be sufficient to demonstrate compliance.

2.) The measurements were performed with the integrated power measurement function of the „radio communication tester CMU“ from Rohde & Schwarz. In this way spectrum analyzer instrument limitations can be avoided/minimized. Instead, CMU manufacturers calibration error can be assumed for this measurement.

3.) The transducer factors (determined within the anechoic-chamber calibration) corresponding to the carrier frequency were entered as RF Inputs/Outputs attenuation of the CMU. Therefore the levels measured are referred to the output level of the EUT and shifted to the actual level at the input connector of the CMU.

4.) During rotation of the EUT the maximum power levels of the GSM-Bursts were recorded: average and peak values. This was performed for both polarization’s of the measuring antennas.

The configuration of the signaling unit is shown in chapter ‘Parameter settings on mobile phone’.

5.3.3. Results

The EUT is powered with nominal voltage.

EUT Type and S/N or EUT set-up no.	EUT set-up 2; op. 2 = TCH				
Channel:	Transducer factor [dB]	Average power EIRP [dBm]	Peak power EIRP [dBm]	Limit [dBm]	Verdict
512	30,7	29,3	30,1	33	passed
661	30,7	27,1	27,2	33	passed
810	30,7	30,4	30,6	33	passed

5.4. Occupied bandwidth § 2.1049

5.4.1. Test equipment (for reference numbers please see chapter 'List of test equipment')

RF-equipment	Test site	Antenna	Spectrum Analyser	GSM test system
249, 279	☒ radio lab	☐	☒ 264 (FSEK 30)	☒ 298 (CMU 200)
	☐ anechoic chamber	☐	☐ 120 (FSEM 30)	☐
	☐	☐	☐	☐

5.4.2. Test condition and test set-up

T = 22°C, h = 60%, p = 1015hPa

„the occupied bandwidth, that is the frequency bandwidth, such that, below its lower and above its upper frequency limits, the mean powers radiated are each equal to 0.5 percent of the total mean power radiated by a given emission shall be measured under the following conditions as applicable“

(h) transmitters employing digital modulation techniques-when modulated by an input signal such that its amplitude and symbol rate represent the maximum rated conditions under which the equipment will operated. The signal shall be applied through any filter networks, pseudo-random generators or other devices required in normal service“

Settings of spectrum-analyzer

⇒ the Spectrum-Analyzer was fully-calibrated with the internal reference before starting the tests
⇒ Resolution Bandwidth: 1% from applicants stated/measured emission bandwidth
⇒ Span: 1 MHz
⇒ Video BW: 10 times the RBW
⇒ Detector: RMS
⇒ Sweep Time: according GSM dwell-time

The measurements were made at the upper, middle, and lower carrier traffic frequencies of the PCS band. Choosing three representative Tx-carrier frequencies of the mobile phone (1850.2 MHz, 1880 MHz and 1909.8 MHz), should be sufficient to demonstrate compliance.

Additionally the emission bandwidth (-26 dBc bandwidth) was recorded. The results were taken in order to determine according to §24.238 the resolution bandwidth, which should be at least 1% of the emission bandwidth.

The configuration of the signaling unit is shown in chapter ‘Parameter settings on mobile phone’.

5.4.3. Results

The EUT is powered with nominal voltage.

EUT Type and S/N or EUT set-up no.	EUT set-up 1; op. 2 = TCH

5.5. Spurious emissions at antenna terminals § 2.1051

5.5.1. Test equipment (for reference numbers please see chapter 'List of test equipment')

RF-equipment	Test site	Antenna	Spectrum Analyzer	GSM test system
249, 279	☒ radio lab	☐	☒ 264 (FSEK 30)	☒ 298 (CMU 200)
	☐ anechoic chamber	☐	☐ 120 (FSEM 30)	☐
	☐	☐	☐	☐

5.5.2. Test condition and test set-up

T = 23°C, h = 60%, p = 1015 hPa

24.238 (a)
„On any frequency outside a licensee' s frequency block (e.g. A, D, B, etc.) within the USPCS spectrum, the power of any emission shall be attenuated below the transmitter power (P, in Watts) by at least 43+10Log(P) dB"

The spectrum was scanned from 1 MHz to the 10th harmonic of the highest frequency generated within the equipment. A stop frequency of 20 GHz is considered high enough to show compliance for the mobile phone. The specification that emissions shall be attenuated below the transmitter power (P) by at least 43 + 10 log (P) dB, translates in the relevant power range of the mobile phone (1 to 0.001 W) to a constant limit of *-13 dBm*.

Choosing three representative Tx-carrier frequencies of the mobile phone (1850.2 MHz, 1880 MHz and 1909.8 MHz), should be sufficient to demonstrate compliance.

⇒ The emissions were recorded using peak-detector and hold-max function of the spectrum-analyzer. Emissions more than 20 dB under the limit of –13 dBm are especially specified, otherwise the noise floor is recorded.
⇒ The reading on the spectrum-analyzer is automatically corrected by the transducer value (insertion loss)

5.5.3. Settings of spectrum analyzer

24.238 (b)
„Compliance with these provisions is based on the use of measurement instrumentation employing a resolution bandwidth of 1 MHz or greater. However, in the 1 MHz bands immediately outside and adjacent to the frequency block a resolution bandwidth of at least one percent of the emission bandwidth of the fundamental emission of the transmitter may be employed. The emission bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power"

Frequency range	RBW (resolution bandwidth)	VBW (video bandwidth)
1 MHz immediately outside and adjacent the frequency blocks	1% from applicants stated/measured emission bandwidth	10 times the RBW
More than 1 MHz outside and adjacent the frequency blocks	1 MHz	10 MHz

RBW and VBW settings of spectrum analyzer

The configuration of the signaling unit is shown in chapter 'Parameter settings on mobile phone'.

The spectrum was scanned from 1 MHz to the 10th harmonic of the highest frequency generated within the equipment. A stop frequency of 20 GHz is considered high enough to show compliance for the mobile phone. The specification that emissions shall be attenuated below the transmitter power (P) by at least 43 + 10 log (P) dB, translates in the relevant power range of the mobile phone (1 to 0.001 W) to a constant limit of *-13 dBm*.

⇒ By rotating the EUT, the emissions were recorded for each side of the EUT with peak-detector and max-hold function of the spectrum-analyser.
⇒ The frequency of interest is splitted in different defined frequency sweeps – please see diagrams and results.
⇒ A Pre-calibration method is used for the measurements, see chapter 5.1
⇒ Emissions more than 20 dB under the limit of –13 dBm are especially specified, otherwise the noise floor is recorded.
⇒ The reading on the spectrum-analyser is automatically corrected by the transducer value (insertion loss).
⇒ The values are related to EIRP.

5.6.3. Settings of spectrum analyser

24.238 (b)
„Compliance with these provisions is based on the use of measurement instrumentation employing a resolution bandwidth of 1 MHz or greater. However, in the 1 MHz bands immediately outside and adjacent to the frequency block a resolution bandwidth of at least one percent of the emission bandwidth of the fundamental emission of the transmitter may be employed. The emission bandwidth is defined as the width of the signal between two points, one below the carrier centre frequency and one above the carrier centre frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power"

Frequency range	RBW (resolution bandwidth)	VBW (video bandwidth)
1 MHz immediately outside and adjacent the frequency blocks	1% from applicants stated/measured emission bandwidth	10 times the RBW
More than 1 MHz outside and adjacent the frequency blocks	1 MHz	10 MHz

RBW and VBW settings of spectrum analyzer

The configuration of the signalling unit is shown in chapter 'Parameter settings on mobile phone'.

	☒ 331clim. chamber	☐	☐	☐

5.7.2. Test condition and test set-up

T = 20°C, h = 60%, p = 1016 hPa

§24.235

„the frequency stability shall be sufficient to ensure that the fundamental emission stays within the authorized frequency block“

§ 2.1055

(d) The frequency stability shall be measured with variation of primary supply voltage as follows:

(1) Vary primary supply voltage from 85 to 115 percent of the nominal value for other than hand carried battery equipment.

(2) For hand carried, battery powered equipment, reduce primary supply voltage to the battery operating end point which shall be specified by the manufacturer.

⇒ According to the GSM 05.10 standard, the frequency stability of the EUT (MS) shall be within 0.1 ppm compared to signals to received from the base station. This accuracy is considered sufficient to meet Section 24.235, Frequency Stability and sufficient to ensure that the fundamental emission stays within the authorized frequency block.

⇒ in order to maintain the voltage constant over the time period of the tests, a dummy battery was connected to a laboratory power supply. The voltage range is considered according the applicants declared range of operation for the transceiver. If the declared voltage range is lower than the 85%..115% range, than applicants voltage range is taken for measurements.

⇒ see conducted measurement test set-up described in chapter Test Set-up.. The EUT was placed in an environmental climatic chamber

⇒ the mobiles power supply voltage was controlled and set by an external laboratory power supply, the power supply voltage was controlled on the input of the power supply terminals.

⇒ the integrated frequency measurement capability of the CMU was used for determining the frequency shift. The maximum shift in frequency was recorded for each channel during the transmission of 200 Bursts.

The measurements were made at the middle carrier traffic frequency of the PCS band.

Frequency shift against temperature at constant power supply voltage

Determine the carrier frequency for channels 661 at room temperature and nominal voltage [20°C] and expose the mobile station to –30°C. Perform all carrier frequencies measurements in 10°C increments from –30°C to +60°C. For about 1 hours at the specified temperature the mobile was powered-off. After powering-on, the measurements were made within 2 minute for the channel 512, in order to prevent self-warming of the mobile. Before changing to channel 810, the mobile was powered-off for about 10 minutes in order to avoid short term frequency transient effects.

Frequency shift against voltage range at constant temperature of 20° Celsius
Determine the carrier frequency for channel 512 and nominal voltage. Apply Vmax of the EUT and switch off the EUT for about 30 minutes. Record the carrier frequency within 2 minutes after powering-on the mobile. Before proceeding with Vmin switch off the EUT for about 30 minutes.
Record the carrier frequency within 2 minutes after powering-on the mobile. Before proceeding with Vmin switch off the EUT for about 30 minutes
Following voltage range was checked according customers declaration of V_{min} and V_{max}.
The voltage was reduced to the lower end point of the battery, where the mobile phone stops working V_{end} (this shall be specified by the manufacturer) and the frequency was also recorded.

The configuration of the signaling unit is shown in chapter 'Parameter settings on mobile phone'.

6.2. Test systems

Ref.-No.	Test system	Manufacturer	Serial-No.	Interval of calibra-tion	Remark	Cal due
a	EMS radiated anechoic chamber	Siemens/R&S	--	12 M	-	31.03.2003
b	EMS conducted	R&S	--	12 M	-	31.03.2003
c	Radiated spurious emission in anechoic chamber	Siemens/R&S	--	12 M	-	31.10.2002
d	EMI radiated anechoic chamber	Siemens/R&S	--	12 M	-	31.10.2002
e	EMI radiated OATS	HD GmbH	--	36 M	-	01.09.2002

Note / remarks

Calibrated during system calibration:

1a	EMS radiated anechoic chamber
1b	EMS conducted
1c	Radiated spurious emission in anechoic chamber
1d	EMI radiated anechoic chamber
1e	EMI radiated OATS
2	calibration or equipment check immediately before measurement
3	Regulatory maintained equipment for functional check or support purpose, calibration of this equipment has no effect on measuring result
4	Ancillary equipment without calibration e.g. mechanical equipment or monitoring equipment

Interval of calibration

12 M	12 month
24 M	24 month
36 M	36 month
Pre-m	check before starting the measurement
-	without calibration
