3 Test Results

3.1 RF Power Output

Standard FCC Part 24, 10-1-06
Subpart E

The test was performed according to: FCC §2.1046, 10-1-06

3.1.1 Test Description

1) The mobile station was placed inside the fully anechoic chamber on a positioning system. The mobile station was coupled via air link to a Digital Communication Tester (R&S CMU200 Digital Communication Tester/base station simulator) which was located outside the chamber for signalling. The measurement distance between the measurement antenna and the mobile station was 1m.
2) A call was established on a Traffic Channel (TCH) between the mobile station and the base station simulator.
3) A pre-calibration procedure is used so that the readings from the spectrum analyser are corrected and represent the equivalent radiated power (related to a half wave dipole) ERP.
4) All measurements were performed with a spectrum analyser and the appropriate calibrated antennas.
5) Important Analyser Settings:
   - Detector: Peak - Maxhold
   - Frequency span: 15 MHz
   - RBW: 5 MHz
   - VBW: 5 MHz
   - Measuring time: coupled
6) The measurement was performed in steps:
   - The mobile station was rotated in order to find the position of maximum radiated output power. This was performed for both polarisations of the measurement antenna (Vertical + Horizontal)
   - At the position of maximum radiated output power the ERP is measured. The measurement time was chosen long enough to allow the trace to stabilize.
   - The corrected value (EIRP) is recorded in the test report.
   - The steps described above were repeated for the different opoerating modes.

3.1.2 Test Requirements / Limits

§2.1046 Measurements Required: RF Power Output

(a) For transmitters other than single sideband, independent sideband and controlled carrier radiotelephone, power output shall be measured at the RF output terminals when the transmitter is adjusted in accordance with the tune-up procedure to give the values of current and voltage on the circuit elements specified in § 2.1033(c)(8). The electrical

characteristics of the output terminals when this test is made shall be stated.

§24.232 Power and antenna height limits

(c) Mobile/portable stations are limited to 2 watts EIRP peak power and the equipment must employ means to limit the power to the minimum necessary for successful communications.

(d) Peak transmit power must be measured over any interval of continuous transmission using instrumentation calibrated in terms of an rms-equivalent voltage. The measurement results shall be properly adjusted for any instrument limitations, such as detector response times, limited resolution bandwidth capability when compared to the emission bandwidth, sensitivity etc., so as to obtain a true peak measurement for the emission in question over the full bandwidth of the channel.
