# FCC SAR Test Report

APPLICANT : Option NV

EQUIPMENT : Pico GtEx AWS

BRAND NAME : GT Express 442

MODEL NAME : GE 0442

FCC ID : NCMOGE0442

STANDARD : 47 CFR Part 2 (2.1093)

IEEE C95.1-1999

OET Bulletin 65 Supplement C (Edition 01-01)

The product sample received on Mar. 19, 2009 and completely tested on May 06, 2008. We, SPORTON INTERNATIONAL INC., would like to declare that the tested sample has been evaluated in accordance with the procedures and shown the compliance with the applicable technical standards.

The test results in this report apply exclusively to the tested model / sample. Without written approval of SPORTON INTERNATIONAL INC., the test report shall not be reproduced except in full.

1. *Statement of Compliance*

The Specific Absorption Rate (SAR) maximum results found during testing for the **Option NV Pico GtEx AWS GT Express 442 GE 0442** are as follows (with expanded uncertainty 21.9%):

Band	Position	SAR (W/kg)
GSM850	Body	0.687
GSM1900	Body	0.930
WCDMA Band V	Body	0.735
WCDMA Band II	Body	1.16
WCDMA Band IV	Body	1.07

They are in compliance with Specific Absorption Rate (SAR) for general population/uncontrolled exposure limits specified in FCC 47 CFR part 2 (2.1093) and ANSI/IEEE C95.1-1999, and had been tested in accordance with the measurement methods and procedures specified in OET Bulletin 65 Supplement C (Edition 01-01).

Date of End during the Test	May 06, 2009

3. *General Information*

3.1 *Description of Device Under Test (DUT)*

Product Feature & Specification	
DUT Type	Pico GtEx AWS
Trade Name	GT Express 442
Model Name	GE 0442
FCC ID	NCMOGE0442
Tx Frequency	GSM850 : 824 MHz ~ 849 MHz GSM1900 : 1850 MHz ~ 1910 MHz WCDMA Band V : 824 MHz ~ 849 MHz WCDMA Band II : 1850 MHz ~ 1910 MHz WCDMA Band IV : 1710 MHz ~ 1755 MHz
Rx Frequency	GSM850 : 869 MHz ~ 894 MHz GSM1900 : 1930 MHz ~ 1990 MHz WCDMA Band V : 869 MHz ~ 894 MHz WCDMA Band II : 1930 MHz ~ 1990 MHz WCDMA Band IV : 2110 MHz ~ 2155 MHz
Maximum Output Power to Antenna	GSM850 : 31.38 dBm GSM1900 : 29.08 dBm WCDMA Band V : 21.88 dBm WCDMA Band II : 20.15 dBm WCDMA Band IV : 21.12 dBm
Antenna Type	Retractable Antenna
HW Version	2.0
SW Version	2.3.2.0
Type of Modulation	GSM / GPRS : GMSK EDGE : 8PSK WCDMA : QPSK HSDPA : QPSK / 16QAM HSUPA : BPSK
DUT Stage	Identical Prototype

Remark:

1. The above DUT's information was declared by manufacturer. Please refer to the specifications or user's manual for more detailed description.

2. Because the WWAN function is disabled in the retracted mode, only the extended mode was tested.

3.2 *Product Photos*

3.3 Applied Standards

The Specific Absorption Rate (SAR) testing specification, method and procedure for this Pico GtEx AWS is in accordance with the following standards:

- 47 CFR Part 2 (2.1093)
- IEEE C95.1-1999
- OET Bulletin 65 Supplement C (Edition 01-01)
- Preliminary Guidance for Reviewing Applications for Certification of 3G Device. May 2006
- KDB 447498 D01 v03r03
- KDB 941225 D01 v02
- KDB 941225 D03 v01

3.4 Device Category and SAR Limits

This device belongs to portable device category because its radiating structure is allowed to be used within 20 centimeters of the body of the user. Limit for General Population/Uncontrolled exposure should be applied for this device, it is 1.6 W/kg as averaged over any 1 gram of tissue.

3.5 Test Conditions

3.5.1 Ambient Condition

Ambient Temperature	20-24℃
Humidity	<60%

3.5.2 Test Configuration

The device was controlled by using a base station emulator R&S CMU200. Communication between the device and the emulator was established by air link. The distance between the DUT and the antenna of the emulator is larger than 50 cm and the output power radiated from the emulator antenna is at least 30 dB smaller than the output power of DUT. The DUT was set from the emulator to radiate maximum output power during all tests.

For SAR testing, DUT is in GPRS or WCDMA link mode. In GPRS link mode, the DUT was set in GPRS multi-slot class 10 with 2 uplink slots due to highest source-based time-averaged output power. The source-based time-averaged output power list is as follow:

Source-Based Time-Averaged Output Power (dBm)						
	GSM 850			**GSM 1900**		
Mode **Channel**	**128**	**189**	**251**	**512**	**661**	**810**
GPRS 8	22.38	22.38	22.35	19.57	19.65	20.08
GPRS 10	22.34	**22.39**	22.35	21.44	21.51	**21.92**
GPRS 12	22.35	22.38	22.34	21.37	21.40	21.74
EGPRS 8	17.38	17.42	17.40	15.17	15.20	15.71
EGPRS 10	20.38	20.42	20.39	18.16	18.19	18.69
EGPRS 12	19.39	19.42	19.36	20.14	20.17	20.63

The crest factor is 4 for GPRS multi-slot class 10 and 1 for WCDMA link mode.

4. _Specific Absorption Rate (SAR)_

4.1 _Introduction_

SAR is related to the rate at which energy is absorbed per unit mass in an object exposed to a radio field. The SAR distribution in a biological body is complicated and is usually carried out by experimental techniques or numerical modeling. The standard recommends limits for two tiers of groups, occupational/controlled and general population/uncontrolled, based on a person's awareness and ability to exercise control over his or her exposure. In general, occupational/controlled exposure limits are higher than the limits for general population/uncontrolled.

4.2 _SAR Definition_

The SAR definition is the time derivative (rate) of the incremental energy (dW) absorbed by (dissipated in) an incremental mass (dm) contained in a volume element (dv) of a given density.

ρ). The equation description is as below:

$$\text{SAR} = \frac{d}{dt}\left(\frac{dW}{dm}\right) = \frac{d}{dt}\left(\frac{dW}{\rho dv}\right)$$

SAR is expressed in units of Watts per kilogram (W/kg)

SAR measurement can be either related to the temperature elevation in tissue by

$$\text{SAR} = C\,\frac{\delta T}{\delta t}$$

, where C is the specific head capacity, δT is the temperature rise and δt the exposure duration, or related to the electrical field in the tissue by

$$\text{SAR} = \frac{\sigma |E|^2}{\rho}$$

, where σ is the conductivity of the tissue, ρ is the mass density of the tissue and E is the rms electrical field strength.

However for evaluating SAR of low power transmitter, electrical field measurement is typically applied.

5. SAR Measurement Setup

Fig. 5.1 DASY5 System

The DASY5 system for performance compliance tests is illustrated above graphically. This system consists of the following items:

- ➢ A standard high precision 6-axis robot with controller, a teach pendant and software
- ➢ A data acquisition electronic (DAE) attached to the robot arm extension
- ➢ A dosimetric probe equipped with an optical surface detector system
- ➢ The electro-optical converter (ECO) performs the conversion between optical and electrical signals
- ➢ A measurement server performs the time critical tasks such as signal filtering, control of the robot operation and fast movement interrupts.
- ➢ A probe alignment unit which improves the accuracy of the probe positioning
- ➢ A computer operating Windows XP
- ➢ DASY5 software
- ➢ Remove control with teach pendant and additional circuitry for robot safety such as warming lamps, etc.
- ➢ The SAM twin phantom
- ➢ A device holder
- ➢ Tissue simulating liquid
- ➢ Dipole for evaluating the proper functioning of the system

Some of the components are described in details in the following sub-sections.

5.1 DASY5 E-Field Probe System

The SAR measurement is conducted with the dosimetric probe (manufactured by SPEAG).The probe is specially designed and calibrated for use in liquid with high permittivity. The dosimetric probe has special calibration in liquid at different frequency. This probe has a built in optical surface detection system to prevent from collision with phantom.

5.1.1 E-Field Probe Specification
<EX3DV3 Probe>

Construction	Symmetrical design with triangular core Built-in shielding against static charges PEEK enclosure material (resistant to organic solvents)	
Frequency	10 MHz to 6 GHz; Linearity: ± 0.2 dB (30 MHz to 3 GHz)	
Directivity	± 0.3 dB in HSL (rotation around probe axis) ± 0.5 dB in tissue material (rotation normal to probe axis)	
Dynamic Range	10 µW/g to 100 mW/g; Linearity: ± 0.2 dB (noise: typically < 1 µW/g)	
Dimensions	Overall length: 330 mm (Tip: 20 mm) Tip diameter: 2.5 mm (Body: 12 mm) Typical distance from probe tip to dipole centers: 1 mm	
Application	High precision dosimetric measurements in any exposure scenario (e.g., very strong gradient fields). Only probe which enables compliance testing for frequencies up to 6 GHz with precision of better 30%.	**Fig. 5.2 EX3DV3 E-field Probe**

5.1.2 E-Field Probe Calibration

Each probe needs to be calibrated according to a dosimetric assessment procedure with accuracy better than ± 10%. The spherical isotropy shall be evaluated and within ± 0.25dB. The sensitivity parameters (NormX, NormY, and NormZ), the diode compression parameter (DCP) and the conversion factor (ConvF) of the probe are tested. The calibration data are as below:

EX3DV3 sn3514 (Cal: Jan. 21, 2009)			
Item	**X axis**	**Y axis**	**Z axis**
Sensitivity (µV)	0.66	0.70	0.60
Diode Compression Point (mV)	91	94	95
Conversion Factor (Head / Body)	**Frequency (MHz)**	**X,Y,Z axis**	
	800~1000	9.31 / 9.41	
	1710~1910	8.16 / 8.18	
	2200~2400	7.78 / 7.60	
	2500~2700	7.34 / 7.20	
	3400~3600	6.89 / 6.40	
	5100~5300	4.78 / 4.29	
	5200~5400	4.40 / 3.94	
	5400~5600	4.22 / 3.88	
	5500~5700	4.13 / 3.89	
	5700~5900	4.13 / 3.85	
Boundary Effect (Head / Body)	**Frequency (MHz)**	**Alpha**	**Depth**
	800~1000	0.45 / 0.42	0.76 / 0.76
	1710~1910	0.60 / 0.85	0.63 / 0.56
	2200~2400	0.53 / 0.18	0.63 / 4.17
	2500~2700	0.16 / 0.34	2.19 / 1.14
	3400~3600	0.50 / 0.53	0.86 / 0.81
	5100~5300	0.40 / 0.45	1.70 / 1.75
	5200~5400	0.40 / 0.45	1.70 / 1.75
	5400~5600	0.40 / 0.45	1.70 / 1.75
	5500~5700	0.40 / 0.45	1.70 / 1.75
	5700~5900	0.40 / 0.45	1.70 / 1.75

NOTE: The probe parameters have been calibrated by the SPEAG.

5.2 DATA Acquisition Electronics (DAE)

The data acquisition electronics (DAE) consists of a highly sensitive electrometer-grade preamplifier with auto-zeroing, a channel and gain-switching multiplexer, a fast 16 bit AD-converter and a command decoder and control logic unit. Transmission to the measurement server is accomplished through an optical downlink for data and status information as well as an optical uplink for commands and the clock.

The mechanical probe mounting device includes two different sensor systems for frontal and sideways probe contacts. They are used for mechanical surface detection and probe collision detection.

The input impedance of the DAE is 200M Ohm; the inputs are symmetrical and floating. Common mode rejection is above 80dB.

5.3 Robot

The DASY5 system uses the high precision robots TX90 XL type out of the newer series from Stäubli SA (France). For the 6-axis controller DASY5 system, the CS8C robot controller version from Stäubli is used. The XL robot series have many features that are important for our application:

- ➢ High precision (repeatability 0.02 mm)
- ➢ High reliability (industrial design)
- ➢ Jerk-free straight movements
- ➢ Low ELF interference (the closed metallic construction shields against motor control fields)
- ➢ 6-axis controller

5.4 Measurement Server

The DASY5 measurement server is based on a PC/104 CPU board with
400 MHz CPU
128 MB chipdisk and
128 MB RAM.

Communication with
the DAE electronic box
the 16-bit AD-converter system for optical detection and digital I/O interface.

The measurement server performs all the real-time data evaluation for field measurements and surface detection, controls robot movements and handles safety operations.
5.5 SAM Twin Phantom

The SAM twin phantom is a fiberglass shell phantom with 2mm shell thickness (except the ear region where shell thickness increases to 6mm). It has three measurement areas:

➢ Left head
➢ Right head
➢ Flat phantom

The bottom plate contains three pair of bolts for locking the device holder. The device holder positions are adjusted to the standard measurement positions in the three sections. A white cover is provided to tap the phantom during off-periods to prevent water evaporation and changes in the liquid parameters. On the phantom top, three reference markers are provided to identify the phantom position with respect to the robot.

The phantom can be used with the following tissue simulating liquids:
*Water-sugar based liquid
*Glycol based liquids

Fig. 5.3 Top View of Twin Phantom

5.6 Device Holder for SAM Twin Phantom

The SAR in the Phantom is approximately inversely proportional to the square of the distance between the source and the liquid surface. For a source in 5 mm distance, a positioning uncertainty of ±0.5mm would produce a SAR uncertainty of ± 20%. An accurate device position is therefore crucial for accurate and repeatable measurement. The position in which the devices must be measured, are defined by the standards.

The DASY5 device holder is designed to cope with different positions given in the standard. It has two scales for the device rotation (with respect to the body axis) and the device inclination (with respect to the line between the ear reference points). The rotation center for both scales is the ear reference point (EPR).

Thus the device needs no repositioning when changing the angles.

The DASY5 device holder has been made out of low-loss POM material having the following dielectric parameters: relative permittivity εr =3 and loss tangent δ = 0.02. The amount of dielectric material has been reduced in the closest vicinity of the device, since measurements have suggested that the influence of the clamp on the test results could thus be lowered.

5.7 Data Storage and Evaluation

5.7.1 Data Storage

The DASY5 software stores the assessed data from the data acquisition electronics as raw data (in microvolt readings from the probe sensors), together with all the necessary software parameters for the data evaluation (probe calibration data, liquid parameters and device frequency and modulation data) in measurement files with the extension. The post-processing software evaluates the desired unit and format for output each time the data is visualized or exported. This allows verification of the complete software setup even after the measurement and allows correction of erroneous parameter settings. For example, if a measurement has been performed with an incorrect crest factor parameter in the device setup, the parameter can be corrected afterwards and the data can be reevaluated.

The measured data can be visualized or exported in different units or formats, depending on the selected probe type (e.g., [V/m], [A/m], [mW/g]). Some of these units are not available in certain situations or give meaningless results, e.g., a SAR-output in a non-lose media, will always be zero. Raw data can also be exported to perform the evaluation with other software packages.

5.7.2 Data Evaluation

The DASY5 post-processing software (SEMCAD) automatically executes the following procedures to calculate the field units from the microvolt readings at the probe connector. The parameters used in the evaluation are stored in the configuration modules of the software：

Probe parameters：	- Sensitivity	$Norm_i$, a_{i0}, a_{i1}, a_{i2}
	- Conversion factor	$ConvF_i$
	- Diode compression point	dcp_i
Device parameters：	- Frequency	f
	- Crest factor	cf
Media parameters：	- Conductivity	σ
	- Density	ρ

These parameters must be set correctly in the software. They can be found in the component documents or they can be imported into the software from the configuration files issued for the DASY5 components. In the direct measuring mode of the multi-meter option, the parameters of the actual system setup are used. In the scan visualization and export modes, the parameters stored in the corresponding document files are used.

The first step of the evaluation is a linearization of the filtered input signal to account for the compression characteristics of the detector diode. The compensation depends on the input signal, the diode type and the DC-transmission factor from the diode to the evaluation electronics. If the exciting field is pulsed, the crest factor of the signal must be known to correctly compensate for peak power.

SPORTON INTERNATIONAL INC.
TEL : 886-3-327-3456
FAX : 886-3-328-4978
FCC ID : NCMOGE0442

Page Number : 15 of 30
Report Issued Date : May 11, 2009
Report Version : Rev. 01

The formula for each channel can be given as：

$$Vi = U_i + U_i^2 \cdot \frac{cf}{dcp_i}$$

with V_i = **compensated signal of channel i (i = x, y, z)**
            U_i = **input signal of channel i (i = x, y, z)**
            cf = crest factor of exciting field (DASY parameter)
            dcp_i = **diode compression point (DASY parameter)**

From the compensated input signals, the primary field data for each channel can be evaluated：

E-field probes： $E_i = \sqrt{\dfrac{V_i}{Norm_i ConvF}}$

H-field probes： $H_i = \sqrt{V_i} \dfrac{a_{i0+} a_{i1} f + a_{i2} f^2}{f}$

with V_i = compensated signal of channel i (i = x, y, z)
            $Norm_i$ = sensor sensitivity of channel i (i = x, y, z)
                        µV/(V/m)2 for E-field Probes
            ConvF = sensitivity enhancement in solution
            a_{ij} = sensor sensitivity factors for H-field probes
            f = carrier frequency [GHz]
            E_i = electric field strength of channel i in V/m
            H_i = magnetic field strength of channel i in A/m

The RSS value of the field components gives the total field strength (Hermitian magnitude)：

$$E_{tot} = \sqrt{E_X^2 + E_Y^2 + E_Z^2}$$

The primary field data are used to calculate the derived field units.

$$SAR = E_{tot}^2 \cdot \frac{\sigma}{\rho \cdot 1000}$$

with   **SAR** = local specific absorption rate in mW/g
            Etot = total field strength in V/m
            σ = conductivity in [mho/m] or [Siemens/m]
            ρ = equivalent tissue density in g/cm^3

＊Note that the density is set to 1, to account for actual head tissue density rather than the density of the tissue simulating liquid.

The power flow density is calculated assuming the excitation field to be a free space field.

$$P_{pwe} = \frac{E_{tot}^2}{3770} \quad \text{or} \quad P_{pwe} = H_{tot}^2 \cdot 37.7$$

with   **Ppwe** = equivalent power density of a plane wave in mW/cm2
            Etot = total electric field strength in V/m
            Htot = total magnetic field strength in A/m

6. <u>Tissue Simulating Liquids</u>

For the measurement of the field distribution inside the SAM phantom with DASY5, the phantom must be filled with around 25 liters of homogeneous tissue simulating liquid. The liquid height from the ear reference point (ERP) of the phantom to the liquid top surface is (head SAR)or from the flat phantom to the liquid top surface (body SAR) is 15.2cm.

The following ingredients for tissue simulating liquid are used:

- ➢ **Water:** deionized water (pure H20), resistivity ≧16MΩ- as basis for the liquid
- ➢ **Sugar**: refined sugar in crystals, as available in food shops – to reduce relative permittivity
- ➢ **Salt**: pure NaCl – to increase conductivity
- ➢ **Cellulose**: Hydroxyethyl-cellulose, medium viscosity (75-125 mPa.s, 2% in water, 20°C), CAS#54290-to increase viscosity and to keep sugar in solution.
- ➢ **Preservative**: Preventol D-7 Bayer AG, D-51368 Leverkusen, CAS#55965-84-9- to prevent the spread of bacteria and molds.
- ➢ **DGMBE**: Deithlenglycol-monobuthyl ether (DGMBE), Fluka Chemie GmbH, CAS#112-34-5 – to reduce relative permittivity.

Table 6.1 gives the recipes for tissue simulating liquid.

Frequency (MHz)	Water (%)	Sugar (%)	Cellulose (%)	Salt (%)	Preventol (%)	DGBE (%)	Conductivity (σ)	Permittivity (εr)
For Head								
835	40.3	57.9	0.2	1.4	0.2	0	0.90	41.5
900	40.3	57.9	0.2	1.4	0.2	0	0.97	41.5

7. *Uncertainty Assessment*

The component of uncertainly may generally be categorized according to the methods used to evaluate them. The evaluation of uncertainly by the statistical analysis of a series of observations is termed a Type An evaluation of uncertainty. The evaluation of uncertainty by means other than the statistical analysis of a series of observation is termed a Type B evaluation of uncertainty. Each component of uncertainty, however evaluated, is represented by an estimated standard deviation, termed standard uncertainty, which is determined by the positive square root of the estimated variance.

A Type A evaluation of standard uncertainty may be based on any valid statistical method for treating data. This includes calculating the standard deviation of the mean of a series of independent observations; using the method of least squares to fit a curve to the data in order to estimate the parameter of the curve and their standard deviations; or carrying out an analysis of variance in order to identify and quantify random effects in certain kinds of measurement.

A type B evaluation of standard uncertainty is typically based on scientific judgment using all of the relevant information available. These may include previous measurement data, experience and knowledge of the behavior and properties of relevant materials and instruments, manufacture's specification, data provided in calibration reports and uncertainties assigned to reference data taken from handbooks. Broadly speaking, the uncertainty is either obtained from an outdoor source or obtained from an assumed distribution, such as the normal distribution, rectangular or triangular distributions indicated in Table 7.1

Uncertainty Distributions	Normal	Rectangular	Triangular	U-shape
Multiplying factor[a]	$1/k$ [b]	$1/\sqrt{3}$	$1/\sqrt{6}$	$1/\sqrt{2}$

(a) standard uncertainty is determined as the product of the multiplying factor and the estimated range of variations in the measured quantity

(b) κ is the coverage factor

Table 7.1 Standard Uncertainty for Assumed Distribution

The combined standard uncertainty of the measurement result represents the estimated standard deviation of the result. It is obtained by combining the individual standard uncertainties of both Type A and Type B evaluation using the usual "root-sum-squares" (RSS) methods of combining standard deviations by taking the positive square root of the estimated variances.

Expanded uncertainty is a measure of uncertainty that defines an interval about the measurement result within which the measured value is confidently believed to lie. It is obtained by multiplying the combined standard uncertainty by a coverage factor. Typically, the coverage factor ranges from 2 to 3. Using a coverage factor allows the true value of a measured quantity to be specified with a defined probability within the specified uncertainty range. For purpose of this document, a coverage factor two is used, which corresponds to confidence interval of about 95 %. The DASY5 uncertainty Budget is showed in Table 7.2.

8. <u>SAR Measurement Evaluation</u>

Each DASY5 system is equipped with one or more system validation kits. These units, together with the predefined measurement procedures within the DASY5 software, enable the user to conduct the system performance check and system validation. System validation kit includes a dipole, tripod holder to fix it underneath the flat phantom and a corresponding distance holder.

8.1 <u>Purpose of System Performance check</u>

The system performance check verifies that the system operates within its specifications. System and operator errors can be detected and corrected. It is recommended that the system performance check be performed prior to any usage of the system in order to guarantee reproducible results. The system performance check uses normal SAR measurements in a simplified setup with a well characterized source. This setup was selected to give a high sensitivity to all parameters that might fail or vary over time. The system check does not intend to replace the calibration of the components, but indicates situations where the system uncertainty is exceeded due to drift or failure.

8.2 <u>System Setup</u>

In the simplified setup for system evaluation, the DUT is replaced by a calibrated dipole and the power source is replaced by a continuous wave which comes from a signal generator at frequency 835 MHz, 1800 MHz, and 1900 MHz. The calibrated dipole must be placed beneath the flat phantom section of the SAM twin phantom with the correct distance holder. The distance holder should touch the phantom surface with a light pressure at the reference marking and be oriented parallel to the long side of the phantom. The equipment setup is shown below:

Fig. 8.1 System Setup for System Evaluation

3. Directional Coupler
4. Power Meter
5. 835 MHz, 1800 MHz, or 1900 MHz Dipole

The output power on dipole port must be calibrated to 20dBm (100mW) before dipole is connected.
Fig 8.2 Dipole Setup

8.3 Validation Results

Comparing to the original SAR value provided by SPEAG, the validation data should be within its specification of 10 %. Table 8.1 shows the target SAR and measured SAR after normalized to 1W input power. The table below indicates the system performance check can meet the variation criterion.

Frequency (MHz)	Position	SAR	Target (W/kg)	Measurement Data (W/kg)	Variation	Measurement Date
835	Body	SAR (1g)	9.52	9.39	-1.4 %	May 06, 2009
		SAR (10g)	6.37	6.10	-4.2 %	
1800	Body	SAR (1g)	38.5	39.7	3.1 %	May 05, 2009
		SAR (10g)	20.9	21.0	0.5 %	
1900	Body	SAR (1g)	40.1	40.4	0.7 %	May 05, 2009
		SAR (10g)	21.3	20.8	-2.3 %	
		SAR (1g)	40.1	39.3	-2.0 %	May 06, 2009
		SAR (10g)	21.3	20.3	-4.7 %

10. _Measurement Procedures_

The measurement procedures are as follows:

- ➤ Linking DUT with base station emulator CMU200 in middle channel
- ➤ Setting CMU200 to allow DUT to radiate maximum output power
- ➤ Measuring output power through RF cable and power meter
- ➤ Placing the DUT in the positions described in the last section
- ➤ Setting scan area, grid size and other setting on the DASY5 software
- ➤ Taking data for the middle channel
- ➤ Repeat previous steps for the lowest and highest channels

According to the OET Bulletin 65 Supplement C standard, the recommended procedure for assessing the peak spatial-average SAR value consists of the following steps:

- ➤ Power reference measurement
- ➤ Area scan
- ➤ Zoom scan
- ➤ Power reference measurement

10.1 _Spatial Peak SAR Evaluation_

The procedure for spatial peak SAR evaluation has been implemented according to the OET Bulletin 65 Supplement C standard. It can be conducted for 1g and 10g, as well as for user-specific masses. The DASY5 software includes all numerical procedures necessary to evaluate the spatial peak SAR value.

The base for the evaluation is a "cube" measurement. The measured volume must include the 1g and 10g cubes with the highest averaged SAR values. For that purpose , the center of the measured volume is aligned to the interpolated peak SAR value of a previously performed area scan.

The entire evaluation of the spatial peak values is performed within the post-processing engine (SEMCAD). The system always gives the maximum values for the 1g and 10g cubes. The algorithm to find the cube with highest averaged SAR is divided into the following stages:

- extraction of the measured data (grid and values) from the Zoom Scan
- calculation of the SAR value at every measurement point based on all stored data (A/D values and measurement parameters)
- generation of a high-resolution mesh within the measured volume
- interpolation of all measured values form the measurement grid to the high-resolution grid
- extrapolation of the entire 3-D field distribution to the phantom surface over the distance from sensor to surface
- calculation of the averaged SAR within masses of 1g and 10g

10.2 Scan Procedures

First Area Scan is used to locate the approximate location(s) of the local peak SAR value(s). The measurement grid within an Area Scan is defined by the grid extent, grid step size and grid offset. Next, in order to determine the EM field distribution in a three-dimensional spatial extension, Zoom Scan is required. The Zoom Scan measures 5x5x7 points with step size 8, 8 and 5 mm. The Zoom Scan is performed around the highest E-field value to determine the averaged SAR-distribution over 1 g.

10.3 SAR Averaged Methods

In DASY5, the interpolation and extrapolation are both based on the modified Quadratic Shepard's method. The interpolation scheme combines a least-square fitted function method and a weighted average method which are the two basic types of computational interpolation and approximation.

Extrapolation routines are used to obtain SAR values between the lowest measurement points and the inner phantom surface. The extrapolation distance is determined by the surface detection distance and the probe sensor offset. The uncertainty increases with the extrapolation distance. To keep the uncertainty within 1% for the 1 g and 10 g cubes, the extrapolation distance should not be larger than 5 mm.

Appendix A - System Performance Check Data

Test Laboratory: Sporton International Inc. SAR/HAC Testing Lab   Date: 2009/5/6

System Check_Body_835MHz_090506

DUT: Dipole 835 MHz

Communication System: CW; Frequency: 835 MHz;Duty Cycle: 1:1
Medium: MSL_850_090506 Medium parameters used: f = 835 MHz; σ = 0.954 mho/m; ε_r = 52.8; ρ = 1000 kg/m^3
Ambient Temperature：22.7 ℃; Liquid Temperature：21.6 ℃

DASY5 Configuration:
- Probe: EX3DV3 - SN3514; ConvF(9.41, 9.41, 9.41); Calibrated: 2009/1/21
- Sensor-Surface: 4mm (Mechanical Surface Detection)
- Electronics: DAE3 Sn577; Calibrated: 2008/11/12
- Phantom: ELI 4.0; Type: QDOVA001BA; Serial: 1029
- Measurement SW: DASY5, V5.0 Build 125; SEMCAD X Version 13.4 Build 125

Pin=100mW/Area Scan (61x61x1): Measurement grid: dx=15mm, dy=15mm
Maximum value of SAR (interpolated) = 1.01 mW/g

Pin=100mW/Zoom Scan (7x7x7)/Cube 0: Measurement grid: dx=5mm, dy=5mm, dz=5mm
Reference Value = 32.5 V/m; Power Drift = 0.016 dB
Peak SAR (extrapolated) = 1.45 W/kg
SAR(1 g) = 0.939 mW/g; SAR(10 g) = 0.610 mW/g
Maximum value of SAR (measured) = 1.01 mW/g
0 dB = 1.01mW/g

Test Laboratory: Sporton International Inc. SAR/HAC Testing Lab   Date: 2009/5/5

System Check_Body_1800MHz_090505

DUT: Dipole 1800 MHz

Communication System: CW; Frequency: 1800 MHz;Duty Cycle: 1:1
Medium: MSL_1800_090505 Medium parameters used: f = 1800 MHz; σ = 1.57 mho/m; ε_r = 52.1; ρ = 1000 kg/m³
Ambient Temperature：22.7 ℃； Liquid Temperature：21.1 ℃

DASY5 Configuration:
- Probe: EX3DV3 - SN3514; ConvF(8.18, 8.18, 8.18); Calibrated: 2009/1/21
- Sensor-Surface: 4mm (Mechanical Surface Detection)
- Electronics: DAE3 Sn577; Calibrated: 2008/11/12
- Phantom: ELI 4.0; Type: QDOVA001BA; Serial: 1029
- Measurement SW: DASY5, V5.0 Build 125; SEMCAD X Version 13.4 Build 125

Pin=100mW/Area Scan (61x61x1): Measurement grid: dx=15mm, dy=15mm
Maximum value of SAR (interpolated) = 4.55 mW/g

Pin=100mW/Zoom Scan (7x7x7)/Cube 0: Measurement grid: dx=5mm, dy=5mm, dz=5mm
Reference Value = 52.5 V/m; Power Drift = 0.101 dB
Peak SAR (extrapolated) = 7.26 W/kg
SAR(1 g) = 3.97 mW/g; SAR(10 g) = 2.1 mW/g
Maximum value of SAR (measured) = 4.45 mW/g
0 dB = 4.45mW/g

Test Laboratory: Sporton International Inc. SAR/HAC Testing Lab   Date: 2009/5/5

System Check_Body_1900MHz_090505

DUT: Dipole 1900 MHz

Communication System: CW; Frequency: 1900 MHz;Duty Cycle: 1:1
Medium: MSL_1900_090505 Medium parameters used: f = 1900 MHz; σ = 1.55 mho/m; $ε_r$ = 52.2; ρ = 1000 kg/m^3
Ambient Temperature：22.8 ℃; Liquid Temperature：21.4 ℃

DASY5 Configuration:
- Probe: EX3DV3 - SN3514; ConvF(8.18, 8.18, 8.18); Calibrated: 2009/1/21
- Sensor-Surface: 4mm (Mechanical Surface Detection)
- Electronics: DAE3 Sn577; Calibrated: 2008/11/12
- Phantom: ELI 4.0; Type: QDOVA001BA; Serial: 1029
- Measurement SW: DASY5, V5.0 Build 125; SEMCAD X Version 13.4 Build 125

Pin=100mW/Area Scan (91x91x1): Measurement grid: dx=10mm, dy=10mm
Maximum value of SAR (interpolated) = 4.64 mW/g

Pin=100mW/Zoom Scan (7x7x7)/Cube 0: Measurement grid: dx=5mm, dy=5mm, dz=5mm
Reference Value = 52.7 V/m; Power Drift = 0.091 dB
Peak SAR (extrapolated) = 7.52 W/kg
SAR(1 g) = 4.04 mW/g; SAR(10 g) = 2.08 mW/g
Maximum value of SAR (measured) = 4.57 mW/g

0 dB = 4.57mW/g

Test Laboratory: Sporton International Inc. SAR/HAC Testing Lab   Date: 2009/5/6
System Check_Body_1900MHz_090506

DUT: Dipole 1900 MHz

Communication System: CW; Frequency: 1900 MHz;Duty Cycle: 1:1
Medium: MSL_1900_090506 Medium parameters used: f = 1900 MHz; σ = 1.53 mho/m; $ε_r$ = 51.6; ρ = 1000 kg/m^3
Ambient Temperature：22.6 ℃; Liquid Temperature：21.3 ℃

DASY5 Configuration:
- Probe: EX3DV3 - SN3514; ConvF(8.18, 8.18, 8.18); Calibrated: 2009/1/21
- Sensor-Surface: 4mm (Mechanical Surface Detection)
- Electronics: DAE3 Sn577; Calibrated: 2008/11/12
- Phantom: ELI 4.0; Type: QDOVA001BA; Serial: 1029
- Measurement SW: DASY5, V5.0 Build 125; SEMCAD X Version 13.4 Build 125

Pin=100mW/Area Scan (91x91x1): Measurement grid: dx=10mm, dy=10mm
Maximum value of SAR (interpolated) = 4.63 mW/g

Pin=100mW/Zoom Scan (7x7x7)/Cube 0: Measurement grid: dx=5mm, dy=5mm, dz=5mm
Reference Value = 52.5 V/m; Power Drift = 0.059 dB
Peak SAR (extrapolated) = 7.34 W/kg
SAR(1 g) = 3.93 mW/g; SAR(10 g) = 2.03 mW/g
Maximum value of SAR (measured) = 4.45 mW/g

0 dB = 4.45mW/g

Appendix B - SAR Measurement Data

Test Laboratory: Sporton International Inc. SAR/HAC Testing Lab   Date: 2009/5/6
#21 Body_GSM850 Ch251_GPRS10

DUT: 931931

Communication System: GSM850; Frequency: 848.8 MHz;Duty Cycle: 1:4
Medium: MSL_850_090506 Medium parameters used: f = 849 MHz; σ = 0.967 mho/m; ε_r = 52.6; ρ = 1000 kg/m^3
Ambient Temperature：22.6 ℃； Liquid Temperature：21.6 ℃

DASY5 Configuration:
- Probe: EX3DV3 - SN3514; ConvF(9.41, 9.41, 9.41); Calibrated: 2009/1/21
- Sensor-Surface: 4mm (Mechanical Surface Detection)
- Electronics: DAE3 Sn577; Calibrated: 2008/11/12
- Phantom: ELI 4.0; Type: QDOVA001BA; Serial: 1029
- Measurement SW: DASY5, V5.0 Build 125; SEMCAD X Version 13.4 Build 125

Ch251/Area Scan (51x51x1): Measurement grid: dx=15mm, dy=15mm
Maximum value of SAR (interpolated) = 0.743 mW/g

Ch251/Zoom Scan (5x5x7)/Cube 0: Measurement grid: dx=8mm, dy=8mm, dz=5mm
Reference Value = 21.8 V/m; Power Drift = -0.122 dB
Peak SAR (extrapolated) = 1.04 W/kg
SAR(1 g) = 0.687 mW/g; SAR(10 g) = 0.437 mW/g
Maximum value of SAR (measured) = 0.711 mW/g

0 dB = 0.711mW/g

Test Laboratory: Sporton International Inc. SAR/HAC Testing Lab   Date: 2009/5/5

#09 Body_GSM1900 Ch810_GPRS10

DUT: 931930

Communication System: PCS 1900; Frequency: 1909.8 MHz;Duty Cycle: 1:4
Medium: MSL_1900_090505 Medium parameters used: f = 1910 MHz; σ = 1.56 mho/m; ε_r = 52.2; ρ = 1000 kg/m^3
Ambient Temperature：22.8 ℃; Liquid Temperature：21.4 ℃

DASY5 Configuration:
- Probe: EX3DV3 - SN3514; ConvF(8.18, 8.18, 8.18); Calibrated: 2009/1/21
