3.7. Configuration of cables used for testing

For the measurements the Ethernet CAT5 cable port was connected to a computer. Call establishment and band selection in GSM mode as well as WLAN specific settings can be set-up by AT-commands sent from the notebook to the EUT.

4. Measurement and Test Set-up's

4.1. Radiated measurements

The radiated emissions from the test device are measured first in a semi or fully anechoic chamber with the dimensions of 12 x 8 x 8 meter.

The EUT and accessories are placed on a non-conducting table of 0.8 meter height, positioned as typical use.

The EUT is powered 5V DC by a external AC/DC-supply with AC nominal voltage of 110V/60Hz. The signalling is performed from outside the chamber with a communication test center (CMU) by airlink.

5. Measurements: Radio Frequency Exposure Evaluation: Mobile Equipment

REFERENCES: §1.1310, § 2.1091

The criteria used for the evaluation of human exposure to radio frequency radiation is table 1 according §1.1310. As the mobile equipment is authorized under Part 22 (Subpart H) and Part 24 (Subpart E) of the FCC Rules, it is subject for evaluation of the RF exposure prior to equipment authorization.

§2.1091: *Further information on evaluating compliance with these limits can be found in the FCC’s OST/OET Bulletin Number 65, “Evaluating Compliance with FCC-Specified Guidelines for Human Exposure to Radiofrequency Radiation.”*

For purposes of these requirements mobile devices are defined by the FCC as transmitters designed to be used in other than fixed locations and to generally be used in such a way that a separation distance of at least 20 centimeters is normally maintained between radiating structures and the body of the user or nearby persons. These devices are normally evaluated for exposure potential with relation to the MPE limits given in Table 1 of Appendix A.

§1.1310, Table 1: LIMITS FOR MAXIMUM PERMISSIBLE EXPOSURE (MPE)

TABLE 1—LIMITS FOR MAXIMUM PERMISSIBLE EXPOSURE (MPE)—Continued

Frequency range (MHz)	Electric field strength (V/m)	Magnetic field strength (A/m)	Power density (mW/cm ²)	Averaging time (minutes)
30–300	61.4	0.163	1.0	6
300–1500			f/300	6
1500–100,000			5	6
(B) Limits for General Population/Uncontrolled Exposure				
0.3–1.34	614	1.63	*(100)	30
1.34–30	824/f	2.19/f	*(180/f ²)	30
30–300	27.5	0.073	0.2	30
300–1500			f/1500	30
1500–100,000			1.0	30

f = frequency in MHz

Prediction of the power density in the far-field of one single radiating antenna can be made by following equation:

$$S = \frac{EIRP}{4\pi R^2}$$

Abbreviations:

- S: Power density (unit: mW/cm²)
- EIRP: Equivalent isotropically radiated power, determined within a separate measurement (unit: mW)
- R: distance to the center of the radiation of the antenna (unit: cm)

MEASUREMENT METHOD

The equipment ERP/EIRP power value was checked for 3 frequencies (lowest/middle/highest) within each operable band.

For the RF-exposure measurement, only GSM 850 mode used as Worst-case GSM op. mode. Please see detailed EIRP measurement method and results in test report **B_2_20719349c/07** dated 20.12.2007.

GSM-Mode:

Band	Channel no.	Channel Frequency [MHz]	Power-Values	
			[mWatt]	
GSM 850	128	824,2	1774,18	ERP-Value
	192	837	1690,44	
	251	848,8	1348,96	
GSM 1900	512	1850,2	1445,43	EIRP-Value
	661	1880	1625,54	
	810	1808,8	1106,62	

As the WLAN b/g mode can be operational at same time as the GSM/UMTS transmitter, it was decided to measure both transmitters turned on. This way the Worst-case configuration consisting of internal WLAN-Antenna and external WWAN-Antenna (TELSA-EUT B) could be tested against maximum generated RF-exposure.

From test report **MDE_Opti_0611_FCCh** and **MDE_OPTI_0611_FCCi**, measured by 7-Layers the maximum output power for the WLAN mode could be used for these re-tests.

The maximum output power is generated on WLAN-g mode, channel 1 at 2412 MHz with a radiated EIRP power of 27.83 dBm.

The measurements have been performed with a calibrated broadband field probe *Radisense III*. Enclosed the settings chosen:

Band	High (4MHz..4GHz)
Unit	mW/cm ²
Measurement mode	continuous
Axis	All E _{TOT} (x,y,z-axis)

The measurement field probe was situated at 20cm from the boundary of the equipment. The equipment was rotated to find the worst-case RF-exposure. The maximum found value was recorded for compliance demonstration.

6. Measurement uncertainties

The reported uncertainties are calculated based on the standard uncertainty multiplied with the appropriate coverage factor **k**, such that a confidence level of approximately 95% is achieved.

For uncertainty determination, each component used in the concrete measurement set-up was taken in account and it's contribution to the overall uncertainty according it's statistical distribution calculated.

Following table shows expectable uncertainties for each measurement type.
