REF: NEO50-1272BDA, Declared and reported power.

The Power amplifier used in the unit in the downlink direction is described as a 10W and 5W in the uplink. These amplifiers are used not to produce these levels of power but to ensure good linearity in the multi-carrier environment. It is the third order intercept point we are looking for to ensure the attenuation of unwanted intermodulation products is maximum. In fact the level of each carrier at the output is limited to 13dBm in the downlink, in the uplink the maximum composite power is limited to 2.5W this is achieved by an individual ALC.

If you have any further questions or comments do not hesitate to contact me.

Yours faithfully

For and on behalf

Aerial Facilities Limited
