REF: **NEO**A215SERIES, Declared and reported power.

The Power amplifier used in the unit in the downlink direction is described as a 40W and 1W in the uplink. These amplifiers are used not to produce these levels of power but to ensure good linearity in the multi-carrier environment. It is the third order intercept point we are looking for to ensure the attenuation of unwanted intermodulation products is maximum. In fact the level of total composite carrier output at the antenna port is limited to 37dBm (5W) in the downlink and 10dBm (0.01W) in the uplink this is achieved by automated level control (ALC).

The system is designed to work from a basestation interface, fibre feed and an internal distributed antenna system using radiating cables in a confined space environment.

If you have any further questions or comments do not hesitate to contact me.

Yours faithfully

For and on behalf
