TRaC Wireless Test Report : TRA-014965-47-00-D

Applicant : Axell Wireless

Apparatus : BSR-3308

Specification(s) : CFR47 Part 90, Part 20 & RSS-131

Purpose of Test : Certification

FCCID : NEOBSR3308PS

Certification Number : 8749A-BSR3308PS

Authorised by :

: Radio Product Manager

Issue Date : 8th April 2014

Authorised Copy Number : *PDF*

1.2 Tests Requested By

This testing in this report was requested by :

Aerial House
Asheridge Road
Chesham
Buckinghamshire
HP5 1TU

1.3 Manufacturer

Aerial House
Asheridge Road
Chesham
Buckinghamshire
HP5 1TU

1.4 Apparatus Assessed

The following apparatus was assessed between 15th – 18th July 2013:

BSR-3308

The Axell BSR 3308 NFPA is a band-selective mini-repeater that supports the 800MHz band. The repeater is specifically designed for the operation of ESMR 800 MHz and is band selectable in the 800 MHz range [3 MHz, 10 MHz or 18 MHz bandwidth].

The BSR utilises a distributed antenna system (DAS).

Typically DAS systems are used for in building / tunnel distribution of signals.

1.5 Test Result Summary

Full details of test results are contained within Appendix A. The following table summarises the results of the assessment.

The statements relating to compliance with the standards below apply ONLY as qualified in the notes and deviations stated in sections 1.6 to 1.7 of this test report.

Full details of test results are contained within Appendix A. The following table summarises the results of the assessment.

Test Type	FCC Part	RSS-131 Rule Part	Appendix in Report	Result
RF Gain and Power Output	90.219(d)(3)	4.3	A1 & B1	Pass
Intermodulation Spurious Emissions	90.219(d)(6)	N/A	A2 & B2	Pass
Occupied Bandwidth & Modulation	90.219(4)(e)(iii) 90.210(h)	N/A	A3 & B3	Pass
Spurious Emissions at Antenna Terminals Less than 1MHz	90.219(d)(3) 90.210(h)	N/A	A4 & B4	Pass
Spurious Emissions at Antenna Terminals Greater than 1MHz	90.219(d)(3)	N/A	A5 & B5	Pass
Noise At Antenna Terminals	90.219(d)(6) 90.219(e)(2)	N/A	A6 & B6	Pass
Field Strength of Spurious Emissions	90.219(d)(3)	4.3.2	A7 & B7	Pass
Passband Gain & 20dB bandwidth	N/A	4.2	A8 & B8	Pass
Frequency Stability	90.213	4.4	N/A(note 1)	N/A
Transient behaviour	90.214	4.4	N/A(note 2)	N/A
Audio Frequency Response (a)	TIA EIA-603.3.2.6	4.5	N/A	N/A
Modulation Limiting	TIA EIA-603.3.2.6	N/A	N/A	N/A
Signal Booster Labelling Requirements	20.21(f)(1)(ii)	5.2	N/A	N/A

Notes:

1 The EUT does not contain modulation circuitry, therefore the test was not performed.

2 The EUT is not a keyed carrier system, therefore the test was not performed.

1.8 Notes Relating To Assessment

With regard to this assessment, the following points should be noted:

The results contained in this report relate only to the items tested and were obtained in the period between the date of initial receipt of samples and the date of issue of the report.

The apparatus was set up and exercised using the configurations, modes of operation and arrangements defined in this report only.

Particular operating modes, apparatus monitoring methods and performance criteria required by the standards tested to have been performed except where identified in Section 1.7 of this test report (Deviations from Test Standards).

For emissions testing, throughout this test report, "Pass" indicates that the results for the sample as tested were below the specified limit (refer also to Section 2, Measurement Uncertainty).

Where relevant, the apparatus was only assessed using the monitoring methods and susceptibility criteria defined in this report.

All testing with the exception of testing at the Open Area Test Site was performed under the following environmental conditions:

Temperature	: 17 to 23 °C
Humidity	: 45 to 75 %
Barometric Pressure	: 86 to 106 kPa

All dates used in this report are in the format dd/mm/yy.

This assessment has been performed in accordance with the requirements of ISO/IEC 17025.

1.9 Deviations from Test Standards

There were no deviations from the standards tested to.

Section 2:**Measurement Uncertainty****2.1 Measurement Uncertainty Values**

For the test data recorded in accordance with note (iii) of Section 2.1 the following measurement uncertainty was calculated:

Radio Testing – General Uncertainty Schedule

All statements of uncertainty are expanded standard uncertainty using a coverage factor of 1.96 to give a 95% confidence where no required test level exists.

[1] Adjacent Channel Power

Uncertainty in test result = **1.86dB**

[2] Carrier Power

Uncertainty in test result (Power Meter) = **1.08dB**
Uncertainty in test result (Spectrum Analyser) = **2.48dB**

[3] Effective Radiated Power

Uncertainty in test result = **4.71dB**

[4] Spurious Emissions

Uncertainty in test result = **4.75dB**

[5] Maximum frequency error

Uncertainty in test result (Frequency Counter) = **0.113ppm**
Uncertainty in test result (Spectrum Analyser) = **0.265ppm**

[6] Radiated Emissions, field strength OATS 14kHz-18GHz Electric Field

Uncertainty in test result (14kHz – 30MHz) = **4.8dB**,
Uncertainty in test result (30MHz – 1GHz) = **4.6dB**,
Uncertainty in test result (1GHz – 18GHz) = **4.7dB**

[7] Frequency deviation

Uncertainty in test result = **3.2%**

[8] Magnetic Field Emissions

Uncertainty in test result = **2.3dB**

[9] Conducted Spurious

Uncertainty in test result – Up to 8.1GHz = **3.31dB**
Uncertainty in test result – 8.1GHz – 15.3GHz = **4.43dB**
Uncertainty in test result – 15.3GHz – 21GHz = **5.34dB**
Uncertainty in test result – Up to 26GHz = **3.14dB**

[10] Channel Bandwidth

Uncertainty in test result = **15.5%**

[11] Amplitude and Time Measurement – Oscilloscope

Uncertainty in overall test level = **2.1dB**,
Uncertainty in time measurement = **0.59%**,
Uncertainty in Amplitude measurement = **0.82%**

[12] Power Line Conduction

Uncertainty in test result = **3.4dB**

[13] Spectrum Mask Measurements

Uncertainty in test result = **2.59% (frequency)**
Uncertainty in test result = **1.32dB (amplitude)**

[14] Adjacent Sub Band Selectivity

Uncertainty in test result = **1.24dB**

[15] Receiver Blocking – Listen Mode, Radiated

Uncertainty in test result = **3.42dB**

[16] Receiver Blocking – Talk Mode, Radiated

Uncertainty in test result = **3.36dB**

[17] Receiver Blocking – Talk Mode, Conducted

Uncertainty in test result = **1.24dB**

[18] Receiver Threshold

Uncertainty in test result = **3.23dB**

[19] Transmission Time Measurement

Uncertainty in test result = **7.98%**

Section 3:

Modifications

3.1 Modifications Performed During Assessment

No modifications were performed during the assessment

A5 Spurious Emissions at Antenna Terminals Greater than 1MHz

Test Details:	
Measurement standard	Part 2.1053, 90.219(e)(3)
EUT sample number	S01
Modification state	0
SE in test environment	None
SE isolated from EUT	None
EUT set up	Refer to Appendix C

Bottom Channel

Frequency Range (MHz)	Freq. of Emission (MHz)	Measured Level (dBm)	Attenuator & Cable Losses (dB)	Spurious Emission Level (dBm)	Limit dBm
9 kHz – 9 GHz	No Significant Emissions				-13

Middle Channel

Frequency Range (MHz)	Freq. of Emission (MHz)	Measured Level (dBm)	Attenuator & Cable Losses (dB)	Spurious Emission Level (dBm)	Limit dBm
9 kHz – 9 GHz	No Significant Emissions				-13

Top channel

Frequency Range (MHz)	Freq. of Emission (MHz)	Measured Level (dBm)	Attenuator & Cable Losses (dB)	Spurious Emission Level (dBm)	Limit dBm
9 kHz – 9 GHz	No Significant Emissions				-13

Limit is determined by the outermost step of the emissions mask and is calculated as follows:

At least $43 + 10 \log P$ dB

$$(10\log P_{\text{watts}}) - (43 + 10\log (P_{\text{watts}} * 1000)) = \text{LIMIT} = -13 \text{ dBm}$$

Result

The EUT was found to comply with the limits

Date: 15.JUL.2013 10:25:43

806.0 MHz - 9-150kHz

824.0 MHz - 5GHz - 9GHz

A6 Noise at Antenna Terminals

Test Details:	
Measurement standard	90.219(e)(2), 90.219(d)(6)
EUT sample number	S01
Modification state	0
SE in test environment	None
SE isolated from EUT	None
EUT set up	Refer to Appendix C

Compliance with these levels will be deemed satisfaction of the good engineering practice requirement. In a 10 kHz measurement bandwidth:

- (1) the ERP of noise within the signal booster passband should not exceed -43dBm ;
- and
- (2) the ERP of noise on spectrum more than 1 MHz outside of the signal booster passband should not exceed -70 dBm .
- (3) The noise figure of a signal booster must not exceed 9 dB in either direction

IN BAND AMPLIFIER NOISE

Date: 15.JUL.2013 11:10:09

OUT OF BAND AMPLIFIER NOISE 9-150kHz

Date: 15.JUL.2013 11:10:37

OUT OF BAND AMPLIFIER NOISE 150kHz-9GHz

Date: 15.JUL.2013 11:09:00

Whilst the pass band noise is greater than the -43dBm limit by approximately 7dB, the manufacturer has stated that they mitigate this by using good engineering practice as follows:-

Compliance with FCC deployment rule regarding the radiation of noise

Good engineering practice must be used in regard to the signal booster's noise radiation. Thus, the gain of the signal booster should be set so that the EIRP of the output noise from the signal booster should not exceed the level of -43 dBm in 10 kHz measurement bandwidth.

In the event that the noise level measured exceeds the aforementioned value, the signal booster gain should be decreased accordingly.

In general, the ERP of noise on a spectrum more than 1 MHz outside of the pass band should not exceed -70 dBm in a 10 kHz measurement bandwidth.

The 3308 signal booster has a noise level of -43 dBm in 10 kHz measurement at 1 MHz spectrum outside the passband of the signal booster.

It has an in-band noise level at around -37 dBm in a 10 kHz bandwidth

Therefore the noise at the antenna input port should be calculated based on equation (3)

Equation (3) - Input Noise to service antenna

Input Noise to service antenna:

-43 dBm + Service Antenna gain – Antenna splitter losses in dB – cable loss in dBs

Example:

Signal booster connected to 10 service antennas with a 100m long ½ inch cable.

- *Losses of such a cable with the connectors = ~ 11dB.*
- *Gain = ~ 2 dBi*

Assuming 10 service antennas: antenna splitter losses = 11 dBi

Based on equation (3) Input antenna noise (to the antenna) = -43+2-11 -11=-63 dBm .

The inband input noise to the antenna should be -37+2 -11-11= -57dbm

NOTE: In this example you may be required in general to add an external bandpass filter that would attenuate the out of band noise by additional 7 dbs .

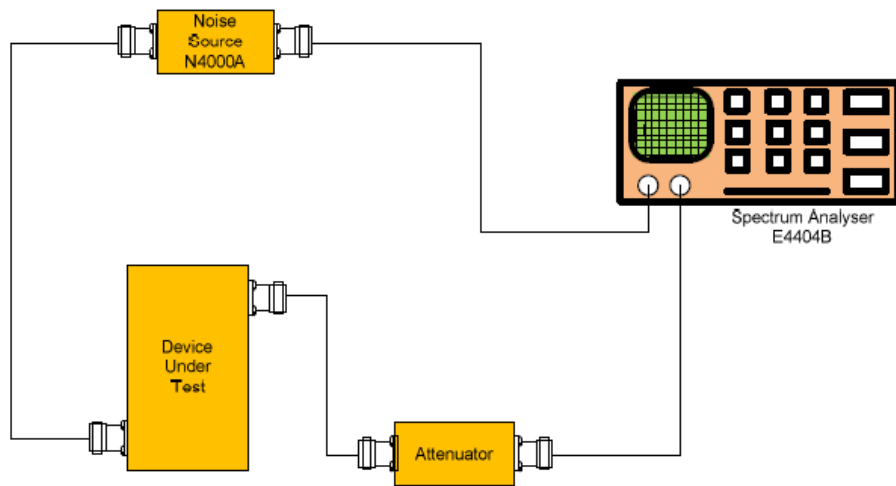

Conclusion:

Good engineering practice requires that in general when the out of band noise measured at the service antenna input is more than -70 dBm per 10 kHz measurement bandwidth, an external band pass filter should be added to attenuate the out of band noise level .

This information was extracted for the user manual.

Signal booster noise figure

Test equipment set up:-

Result

Plots for noise figure, taken with the 18MHz filter applied at maximum gain with 70dB external attenuators in the test set up

Frequency (MHz)	Noise Figure dB
815.0	3.4
806.0	3.95
824.0	4.0

General notes about measurement setup:

- 1) The spectrum analyser has the phase noise measuring personality enabled.

A7 Radiated Electric Field Emissions

Preliminary scans were performed using a peak detector with the RBW = 100kHz. The radiated electric field emission test applies to all spurious and harmonic emissions. The EUT was set to transmit as required.

The following test site was used for final measurements as specified by the standard tested to:

3m open area test site : 3m alternative test site :

The effect of the EUT set-up on the measurements is summarised in note (c) below.

Test Details:	
Measurement standard	Title 47 of the CFR: Part 2.1053, RSS-131 Section 4.3.2

30 MHz – 9 GHz	No Significant Emissions		-13

Top Frequency

FREQUENCY RANGE	FREQ. (MHz)	ERP/EIRP (dBm)	LIMIT (dBm)
30 MHz – 9 GHz	No Significant Emissions		-13

Result

The EUT was found to comply with the limits

Notes:

1. Emissions Checked up to 10 times Fc.
2. The unit was mounted on a turntable and rotated through 360° and in 3 orthogonal planes to find the worst case emission.
3. For Frequencies below 1 GHz, RBW = 120 kHz, testing was performed with CISPR16 compliant test receiver with QP detector. Above 1 GHz tests were performed using a spectrum analyser using the following settings:

Peak Detector RBW = 1MHz; VBW = ≥RBW

4. Limit is determined as the outermost step of the emissions mask and is calculated as follows.

At least 43 + 10 log P dB

$$(10\log P_{\text{watts}}) - (43 + 10\log (P_{\text{watts}} * 1000)) = \text{LIMIT} = -13 \text{ dBm}$$

The upper and lower frequency of the measurement range was decided according to 47 CFR Part 2.1057.

- (a) Where results have been measured at one distance, and a signal level displayed at another, the results have been extrapolated using the following formula:

$$\text{Extrapolation (dB)} = 20 \log_{10} \left(\frac{\text{measurement distance}}{\text{specification distance}} \right)$$

- (b) The levels may have been rounded for display purposes.
- (c) The following table summarises the effect of the EUT operating mode, internal configuration and arrangement of cables / samples on the measured emission levels :

B6 Noise at Antenna Terminals

Test Details:	
Measurement standard	90.219(e)(2), 90.219(d)(6)
EUT sample number	S01
Modification state	0
SE in test environment	None
SE isolated from EUT	None
EUT set up	Refer to Appendix C

Compliance with these levels will be deemed satisfaction of the good engineering practice requirement. In a 10 kHz measurement bandwidth:

(1) the ERP of noise within the signal booster passband should not exceed -43dBm ;

and

(2) the ERP of noise on spectrum more than 1 MHz outside of the signal booster passband should not exceed -70 dBm .

(3) The noise figure of a signal booster must not exceed 9 dB in either direction

IN BAND AMPLIFIER NOISE

Date: 15.JUL.2013 10:46:53

Whilst the pass band noise is greater than the -43dBm limit by approximately 7dB, the manufacturer has stated that they mitigate this by using good engineering practice as follows:-

Compliance with FCC deployment rule regarding the radiation of noise

Good engineering practice must be used in regard to the signal booster's noise radiation. Thus, the gain of the signal booster should be set so that the EIRP of the output noise from the signal booster should not exceed the level of -43 dBm in 10 kHz measurement bandwidth.

In the event that the noise level measured exceeds the aforementioned value, the signal booster gain should be decreased accordingly.

In general, the ERP of noise on a spectrum more than 1 MHz outside of the pass band should not exceed -70 dBm in a 10 kHz measurement bandwidth.

The 3308 signal booster has a noise level of -43 dBm in 10 kHz measurement at 1 MHz spectrum outside the passband of the signal booster.

It has an in-band noise level at around -37 dBm in a 10 kHz bandwidth

Therefore the noise at the antenna input port should be calculated based on equation (3)

Equation (3) - Input Noise to service antenna

Input Noise to service antenna:

-43 dBm + Service Antenna gain – Antenna splitter losses in dB – cable loss in dBs

Example:

Signal booster connected to 10 service antennas with a 100m long ½ inch cable.

- *Losses of such a cable with the connectors = ~ 11dB.*
- *Gain = ~ 2 dBi*

Assuming 10 service antennas: antenna splitter losses = 11 dBi

Based on equation (3) Input antenna noise (to the antenna) = -43+2-11 -11=-63 dBm .

The inband input noise to the antenna should be -37+2 -11-11= -57dbm

NOTE: In this example you may be required in general to add an external bandpass filter that would attenuate the out of band noise by additional 7 dbs .

Conclusion:

Good engineering practice requires that in general when the out of band noise measured at the service antenna input is more than -70 dBm per 10 kHz measurement bandwidth, an external band pass filter should be added to attenuate the out of band noise level .

This information was extracted for the user manual.

Signal booster noise figure

Test equipment set up

Result

Plots for noise figure, taken with the 18MHz filter applied at maximum gain with 70dB external attenuators in the test set up

Frequency (MHz)	Noise Figure dB
851.0	4.4
860.0	3.6
869.0	4.5

General notes about measurement setup:

- 1) The spectrum analyser has the phase noise measuring personality enabled.

B7 Radiated Electric Field Emissions

Preliminary scans were performed using a peak detector with the RBW = 100kHz. The radiated electric field emission test applies to all spurious and harmonic emissions. The EUT was set to transmit as required.

The following test site was used for final measurements as specified by the standard tested to:

3m open area test site : 3m alternative test site :

The effect of the EUT set-up on the measurements is summarised in note (c) below.

Test Details:	
Measurement standard	Title 47 of the CFR: Part 2.1053, RSS-131 Section 4.3.2
Frequency range	30 MHz – 9 GHz
EUT sample number	S01
Modification state	0
SE in test environment	None
SE isolated from EUT	None
EUT set up	Refer to Appendix C
Temperature	23
Photographs (Appendix F)	1 & 2

Bottom Frequency

FREQUENCY RANGE	FREQ. (MHz)	ERP/EIRP (dBm)	LIMIT (dBm)
30 MHz – 9 GHz	No Significant Emissions		-13

Middle Frequency

FREQUENCY RANGE	FREQ. (MHz)	ERP/EIRP (dBm)	LIMIT (dBm)
30 MHz – 9 GHz	No Significant Emissions		-13

Top Frequency

FREQUENCY RANGE	FREQ. (MHz)	ERP/EIRP (dBm)	LIMIT (dBm)
30 MHz – 9 GHz	No Significant Emissions		-13

Result

The EUT was found to comply with the limits

Notes:

1. Emissions Checked up to 10 times Fc.
2. The unit was mounted on a turntable and rotated through 360° and in 3 orthogonal planes to find the worst case emission.
3. For Frequencies below 1 GHz, RBW = 120 kHz, testing was performed with CISPR16 compliant test receiver with QP detector. Above 1 GHz tests were performed using a spectrum analyser using the following settings:

Peak Detector RBW = 1MHz; VBW = ≥RBW

4. Limit is determined as the outermost step of the emissions mask and is calculated as follows.

At least 43 + 10 log P dB

$$(10\log P_{\text{watts}}) - (43 + 10\log (P_{\text{watts}} * 1000)) = \text{LIMIT } = -13 \text{ dBm}$$

The upper and lower frequency of the measurement range was decided according to 47 CFR Part 2.1057.

- (a) Where results have been measured at one distance, and a signal level displayed at another, the results have been extrapolated using the following formula:

$$\text{Extrapolation (dB)} = 20 \log_{10} \left(\frac{\text{measurement distance}}{\text{specification distance}} \right)$$

- (b) The levels may have been rounded for display purposes.

Appendix C:**Additional Test and Sample Details**

This appendix contains details of:

1. The samples submitted for testing.
2. Details of EUT operating mode(s)
3. Details of EUT configuration(s) (see below).
4. EUT arrangement (see below).

Throughout testing, the following numbering system is used to identify the sample and it's modification state:

Sample No: Sxx Mod w

where:

xx	= sample number	eg. S01
w	= modification number	eg. Mod 2

The following terminology is used throughout the test report:

Support Equipment (SE) is any additional equipment required to exercise the EUT in the applicable operating mode. Where relevant SE is divided into two categories:

SE in test environment: The SE is positioned in the test environment and is not isolated from the EUT (e.g. on the table top during REFE testing).

SE isolated from the EUT: The SE is isolated via filtering from the EUT. (e.g. equipment placed externally to the ALSR during REFE testing).

EUT configuration refers to the internal set-up of the EUT. It may include for example:

- Positioning of cards in a chassis.
- Setting of any internal switches.
- Circuit board jumper settings.
- Alternative internal power supplies.

Where no change in EUT configuration is **possible**, the configuration is described as "single possible configuration".

EUT arrangement refers to the termination of EUT ports / connection of support equipment, and where relevant, the relative positioning of samples (EUT and SE) in the test environment.

For further details of the test procedures and general test set ups used during testing please refer to the related document "EMC Test Methods - An Overview", which can be supplied by TRaC Global upon request.

C1) Test samples

The following samples of the apparatus were submitted by the client for testing :

Sample No.	Description	Identification
S01	BSR-3308	12110001

The following samples of apparatus were submitted by the client as host, support or drive equipment (auxiliary equipment):

Sample No.	Description	Identification

The following samples of apparatus were supplied by TRaC Global as support or drive equipment (auxiliary equipment):

Identification	Description

C2) EUT Operating Mode During Testing.

During testing, the EUT was exercised as described in the following tables :

Test	Description of Operating Mode
All tests detailed in this report	Receiving a signal to ensure EUT is operating a maximum gain and maximum output power.

C3) EUT Configuration Information.

The EUT was submitted for testing in one single possible configuration.

C4) List of EUT Ports

The tables below describe the termination of EUT ports:

Sample : S01
Tests : Conducted

Port	Description of Cable Attached	Cable length	Equipment Connected
Mobile	Coaxial	>1m	Sig Gen or Spectrum Analyser
Base	Coaxial	>1m	Sig Gen or Spectrum Analyser
DC Power	M ulticore Mains CAble	30cm	110 – 24 Vdc converter
Ethernet	Cat 5	>1m	Control PC

Sample : S01

Appendix D:

Additional Information

No additional information is included within this test report.

Appendix F:

Photographs and Figures

The following photographs were taken of the test samples:

1. Radiated electric field emissions arrangement: BSR-3308 front view.
2. Radiated electric field emissions arrangement: BSR-3308 close up.
