1.2 Tests Requested By

This testing in this report was requested by :

Axell Wireless Limited
 Aerial House
 Asheridge Road
 Chesham
 Buckinghamshire
 HP5 1TU

1.3 Manufacturer

Axell Wireless Limited
 Aerial House
 Asheridge Road
 Chesham
 Buckinghamshire
 HP5 1TU

1.4 Apparatus Assessed

The following apparatus was assessed between and 3rd March and 10th March 2015

D-SBR 3709S

SMR 900MHz Digital Channel Selective and Band selective repeater.

The D-SBR 3709S digital single band repeater is specifically designed for outdoor and inbuilding for SMR 900MHz applications.

Technical specifications		
Uplink	Downlink	CFR 47 Rule Part 90S
896.00-901.00MHz	935.00MHz – 940.00MHz	

1.5 Test Result Summary

Full details of test results are contained within Appendix A. The following table summarises the results of the assessment.

The statements relating to compliance with the standards below apply ONLY as qualified in the notes and deviations stated in sections 1.6 to 1.7 of this test report.

Full details of test results are contained within Appendix A. The following table summarises the results of the assessment.

Test Type	CFR 47 Part 90 Subpart S	Appendix in Report
RF Power Output	90.219(e)(1)	A1 & B1
Intermodulation Spurious Emissions	90.219(d)(i)	A2 & B2
Occupied Bandwidth & Modulation	90.219(e)(4)	A3 & B3
Spurious Emissions at Antenna Terminals Less than 1 MHz	90.219(e)(1)	A4 & B4
Spurious Emissions at Antenna Terminals Greater than 1MHz	90.219(e)(1)	A5 & B5
Field Strength of Spurious Emissions	90.219(e)(1)	A6 & B6
Passband Gain & 20dB bandwidth	90.219(d)(7)	A7 & B7
Frequency Stability	90.213	N/A(note 1)
Transient behaviour	N/A	N/A(note 2)
Audio Frequency Response (a)	N/A	N/A
Modulation Limiting	N/A	N/A
Signal Booster Labelling Requirements	90.219(e)(5)	N/A

Notes:

1 The EUT does not contain modulation circuitry; therefore the test was not performed.

2 The EUT is not a keyed carrier system; therefore the test was not performed.

1.8 Notes Relating To Assessment

With regard to this assessment, the following points should be noted:

The results contained in this report relate only to the items tested and were obtained in the period between the date of initial receipt of samples and the date of issue of the report.

The apparatus was set up and exercised using the configurations, modes of operation and arrangements defined in this report only.

Particular operating modes, apparatus monitoring methods and performance criteria required by the standards tested to have been performed except where identified in Section 1.7 of this test report (Deviations from Test Standards).

For emissions testing, throughout this test report, "Pass" indicates that the results for the sample as tested were below the specified limit (refer also to Section 2, Measurement Uncertainty).

Where relevant, the apparatus was only assessed using the monitoring methods and susceptibility criteria defined in this report.

All testing with the exception of testing at the Open Area Test Site was performed under the following environmental conditions:

Temperature	: 17 to 23 °C
Humidity	: 45 to 75 %
Barometric Pressure	: 86 to 106 kPa

All dates used in this report are in the format dd/mm/yy.

This assessment has been performed in accordance with the requirements of ISO/IEC 17025.

1.9 Deviations from Test Standards

There were no deviations from the standards tested to.

Section 2:**Measurement Uncertainty****2.1 Measurement Uncertainty Values**

For the test data recorded the following measurement uncertainty was calculated:

Radio Testing – General Uncertainty Schedule

All statements of uncertainty are expanded standard uncertainty using a coverage factor of 1.96 to give a 95% confidence where no required test level exists.

[1] Adjacent Channel Power

Uncertainty in test result = **1.86dB**

[2] Carrier Power

Uncertainty in test result (Power Meter) = **1.08dB**

Uncertainty in test result (Spectrum Analyser) = **2.48dB**

[3] Effective Radiated Power

Uncertainty in test result = **4.71dB**

[4] Spurious Emissions

Uncertainty in test result = **4.75dB**

[5] Maximum frequency error

Uncertainty in test result (Frequency Counter) = **0.113ppm**

Uncertainty in test result (Spectrum Analyser) = **0.265ppm**

[6] Radiated Emissions, field strength OATS 14kHz-18GHz Electric Field

Uncertainty in test result (14kHz – 30MHz) = **4.8dB**,

Uncertainty in test result (30MHz – 1GHz) = **4.6dB**,

Uncertainty in test result (1GHz – 18GHz) = **4.7dB**

[7] Frequency deviation

Uncertainty in test result = **3.2%**

[8] Magnetic Field Emissions

Uncertainty in test result = **2.3dB**

[9] Conducted Spurious

Uncertainty in test result – Up to 8.1GHz = **3.31dB**

Uncertainty in test result – 8.1GHz – 15.3GHz = **4.43dB**

Uncertainty in test result – 15.3GHz – 21GHz = **5.34dB**

Uncertainty in test result – Up to 26GHz = **3.14dB**

[10] Channel Bandwidth

Uncertainty in test result = **15.5%**

[11] Amplitude and Time Measurement – Oscilloscope

Uncertainty in overall test level = **2.1dB**,
Uncertainty in time measurement = **0.59%**,
Uncertainty in Amplitude measurement = **0.82%**

[12] Power Line Conduction

Uncertainty in test result = **3.4dB**

[13] Spectrum Mask Measurements

Uncertainty in test result = **2.59% (frequency)**
Uncertainty in test result = **1.32dB (amplitude)**

[14] Adjacent Sub Band Selectivity

Uncertainty in test result = **1.24dB**

[15] Receiver Blocking – Listen Mode, Radiated

Uncertainty in test result = **3.42dB**

[16] Receiver Blocking – Talk Mode, Radiated

Uncertainty in test result = **3.36dB**

[17] Receiver Blocking – Talk Mode, Conducted

Uncertainty in test result = **1.24dB**

[18] Receiver Threshold

Uncertainty in test result = **3.23dB**

[19] Transmission Time Measurement

Uncertainty in test result = **7.98%**

Section 3:

Modifications

3.1 Modifications Performed During Assessment

No modifications were performed during the assessment

Appendix A:**Uplink Formal Emission Test Results**

A5 Spurious Emissions at Antenna Terminals Greater than 1MHz

Test Details:	
Measurement standard	Part 2.1053, 90.219(e)(1)
EUT sample number	S01
Modification state	0
SE in test environment	None
SE isolated from EUT	None
EUT set up	Refer to Appendix C

Frequency (MHz)	Frequency Range (MHz)	Freq. of Emission (MHz)	Measured Level (dBm)	Attenuator & Cable Losses (dB)	Spurious Emission Level (dBm)	Limit (dBm)
896.100	No Significant Emissions Within 20 dB of limit					-13
898.500						-13
900.900						-13

Limit is determined by the outermost step of the emissions mask and is calculated as follows:

At least $43 + 10 \log P$ dB

$$(10 \log P_{\text{watts}}) - (43 + 10 \log (P_{\text{watts}} * 1000)) = \text{LIMIT} = -13 \text{ dBm}$$

Result

The EUT was found to comply with the limits

A6 Radiated Electric Field Emissions

Preliminary scans were performed using a peak detector with the RBW = 100kHz. The radiated electric field emission test applies to all spurious and harmonic emissions. The EUT was set to transmit as required.

The following test site was used for final measurements as specified by the standard tested to:

3m open area test site :

3m alternative test site :

The effect of the EUT set-up on the measurements is summarised in note (c) below.

Test Details:	
Measurement standard	Part 2.1053, 90.219(e)(1)
Frequency range	30 MHz – 10 GHz
EUT sample number	S01
Modification state	0
SE in test environment	None
SE isolated from EUT	None
EUT set up	Refer to Appendix C
Photographs	Appendix F

Frequency (MHz)	Freq. of Emission (MHz)	ERP/EIRP (dBm)	Limit (dBm)
896.100	No Significant Emissions Within 20 dB of limit		-13
898.500			-13
900.900			-13

Result

The EUT was found to comply with the limits

Notes:

1. Emissions Checked up to 10 times Fc.
2. The unit was mounted on a turntable and rotated through 360° and in 3 orthogonal planes to find the worst case emission.
3. For Frequencies below 1 GHz, RBW = 120 kHz, testing was performed with CISPR16 compliant test receiver with QP detector. Above 1 GHz tests were performed using a spectrum analyser using the following settings:

Peak Detector RBW = 1MHz; VBW = ≥RBW

4. Limit is determined as the outermost step of the emissions mask and is calculated as follows.

At least 43 + 10 log P dB

$$(10\log P_{\text{watts}}) - (43 + 10\log (P_{\text{watts}} * 1000)) = \text{LIMIT} = -13 \text{ dBm}$$

The upper and lower frequency of the measurement range was decided according to 47 CFR Part 2.1057.

- (a) Where results have been measured at one distance, and a signal level displayed at another, the results have been extrapolated using the following formula:

$$\text{Extrapolation (dB)} = 20 \log_{10} \left(\frac{\text{measurement distance}}{\text{specification distance}} \right)$$

- (b) The levels may have been rounded for display purposes.
- (c) The following table summarises the effect of the EUT operating mode, internal configuration and arrangement of cables / samples on the measured emission levels :

	See (i)	See (ii)	See (iii)	See (iv)
Effect of EUT operating mode on emission levels	✓			
Effect of EUT internal configuration on emission levels	✓			
Effect of Position of EUT cables & samples on emission levels			✓	
(i) Parameter defined by standard and / or single possible, refer to Appendix D (ii) Parameter defined by client and / or single possible, refer to Appendix D (iii) Parameter had a negligible effect on emission levels, refer to Appendix D (iv) Worst case determined by initial measurement, refer to Appendix D

A7 Passband Gain & Bandwidth

Test Details:	
Measurement standard	D.3 Policies + Procedures (k) of KDB 935210 D02 Signal Boosters Certification v02, 90.219(d)(7)
EUT sample number	S01
Modification state	0
SE in test environment	None
SE isolated from EUT	None
EUT set up	Refer to Appendix C

BAND	fl	fh	20 dB Bandwidth
896.00-901.00MHz	895.655000MHz	901.345000MHz	5.690MHz

With the aid of a CW Swept signal generator and spectrum analyser, the bandwidth and frequency response of the open channel (i.e. at the point where the gain has fallen by 20 dB) is measured. This measurement shows the gain-versus-frequency response of the open channel from the midband frequency f_0 of the channel up to at least $f_0 + 250\%$ of the 20 dB bandwidth.

Date: 6.MAR.2015 10:37:47

A8 Noise (conducted)

Test Details:	
Measurement standard	90.219(d)(ii)(iii)90.219(e)(2)
Frequency range	30 MHz – 10 GHz
EUT sample number	S01
Modification state	0
SE in test environment	None
SE isolated from EUT	None

See Plot below

Date: 13.MAR.2015 14:29:02

- ii) In general the ERP of noise within the passband should not exceed -43dBm in a 10 kHz measurement bandwidth.
- iii) In general the ERP of noise on the spectrum more than 1MHz outside of the passband should not exceed -70dBm in a 10 kHz measurement bandwidth.

Whilst the pass band noise is greater than the -43dBm limit by approximately 11dB, the manufacturer has stated that they mitigate this by using good engineering practice as follows:-

Compliance with FCC deployment rule regarding the radiation of noise

Good engineering practice must be used in regard to the signal booster's noise radiation. Thus, the gain of the signal booster should be set so that the EIRP of the output noise from the signal booster should not exceed the level of -43 dBm in 10 kHz measurement bandwidth.

In the event that the noise level measured exceeds the aforementioned value, the signal booster gain should be decreased accordingly.

In general, the ERP of noise on a spectrum more than 1 MHz outside of the pass band should not exceed -70 dBm in a 10 kHz measurement bandwidth.

The D-SBR 3709S signal booster has a noise level of -51.10 dBm in 10 kHz measurement at 1 MHz spectrum outside the passband of the signal booster. It has an in-band noise level at around -32 dBm in a 10 kHz bandwidth Therefore the noise at the antenna input port should be calculated based on equation (3)

Equation (3) - Input Noise to service antenna

Input Noise to service antenna:

-43 dBm + Service Antenna gain – Antenna splitter losses in dB – cable loss in dBs

Example:

Signal booster connected to 10 service antennas with a 100m long ½ inch cable.

- *Losses of such a cable with the connectors = ~ 11dB.*
- *Gain = ~ 2 dBi*

Assuming 10 service antennas: antenna splitter losses = 11 dBi

Based on equation (3) Input antenna noise (to the antenna) = -51.1+2-11 -11=-71.1 dBm.

The inband input noise to the antenna should be -32+2 -11-11= -52dbm

NOTE: in this example no external bandpass filter would be required.

Conclusion:

Good engineering practice requires that in general when the out of band noise measured at the service antenna input is more than -70 dBm per 10 kHz measurement bandwidth, an external band pass filter should be added to attenuate the out of band noise level .

As per Part 90.219(e)(2) The noise figure of a signal booster must not exceed 9dB in either direction.

Max noise figure = 2.8195dB.

B5 Spurious Emissions at Antenna Terminals Greater than 1MHz

Test Details:	
Measurement standard	Part 2.1053, 90.219(e)(1)
EUT sample number	S01
Modification state	0
SE in test environment	None
SE isolated from EUT	None
EUT set up	Refer to Appendix C

Frequency (MHz)	Frequency Range (MHz)	Freq. of Emission (MHz)	Measured Level (dBm)	Attenuator & Cable Losses (dB)	Spurious Emission Level (dBm)	Limit (dBm)
935.100	No Significant Emissions Within 20 dB of limit					-13
937.500						-13
939.900						-13

Limit is determined by the outermost step of the emissions mask and is calculated as follows:

At least $43 + 10 \log P$ dB

$$(10 \log P_{\text{watts}}) - (43 + 10 \log (P_{\text{watts}} * 1000)) = \text{LIMIT} = -13 \text{ dBm}$$

Result

The EUT was found to comply with the limits

Note: The plots below are without the use of a notch filter.

B6 Radiated Electric Field Emissions

Preliminary scans were performed using a peak detector with the RBW = 100kHz. The radiated electric field emission test applies to all spurious and harmonic emissions. The EUT was set to transmit as required.

The following test site was used for final measurements as specified by the standard tested to:

3m open area test site : 3m alternative test site :

The effect of the EUT set-up on the measurements is summarised in note (c) below.

Test Details:	
Measurement standard	Part 2.1053, 90.219(e)(1)
Frequency range	30 MHz – 22 GHz
EUT sample number	S01
Modification state	0
SE in test environment	None
SE isolated from EUT	None
EUT set up	Refer to Appendix C

Frequency (MHz)	Freq. of Emission (MHz)	ERP/EIRP (dBm)	Limit (dBm)
935.100	No Significant Emissions Within		-13
937.500			-13
939.900			-13

Result

The EUT was found to comply with the limits

Notes:

1. Emissions Checked up to 10 times Fc.
2. The unit was mounted on a turntable and rotated through 360⁰ and in 3 orthogonal planes to find the worst case emission.
3. For Frequencies below 1 GHz, RBW = 120 kHz, testing was performed with CISPR16 compliant test receiver with QP detector. Above 1 GHz tests were performed using a spectrum analyser using the following settings:

Peak Detector RBW = 1MHz; VBW = ≥RBW

4. Limit is determined as the outermost step of the emissions mask and is calculated as follows.

At least 43 + 10 log P dB

$$(10\log P_{\text{watts}}) - (43 + 10\log (P_{\text{watts}} * 1000)) = \text{LIMIT} = -13 \text{ dBm}$$

The upper and lower frequency of the measurement range was decided according to 47 CFR Part 2.1057.

- (a) Where results have been measured at one distance, and a signal level displayed at another, the results have been extrapolated using the following formula:

$$\text{Extrapolation (dB)} = 20 \log_{10} \left(\frac{\text{measurement distance}}{\text{specification distance}} \right)$$

- (b) The levels may have been rounded for display purposes.
- (c) The following table summarises the effect of the EUT operating mode, internal configuration and arrangement of cables / samples on the measured emission levels :

	See (i)	See (ii)	See (iii)	See (iv)

B7 Passband Gain & Bandwidth

Test Details:	
Measurement standard	D.3 Policies + Procedures (k) of KDB 935210 D02 Signal Boosters Certification v02
EUT sample number	S01
Modification state	0
SE in test environment	None
SE isolated from EUT	None
EUT set up	Refer to Appendix C

BAND	fl	fh	20 dB Bandwidth
935.00MHz – 940.00MHz	934.665000MHz	940.320000MHz	5.655MHz

With the aid of a CW Swept signal generator and spectrum analyser, the bandwidth and frequency response of the open channel (i.e. at the point where the gain has fallen by 20 dB) is measured. This measurement shows the gain-versus-frequency response of the open channel from the midband frequency f_0 of the channel up to at least $f_0 + 250\%$ of the 20 dB bandwidth.

Date: 6.MAR.2015 11:01:06

B8 Noise (Conducted)

Test Details:	
Measurement standard	90.219(d)(ii)(iii)90.219(e)(2)
Frequency range	30 MHz – 10 GHz
EUT sample number	S01
Modification state	0
SE in test environment	None
SE isolated from EUT	None

See Plot below

Date: 13.MAR.2015 14:32:02

- ii) In general the ERP of noise within the passband should not exceed -43dBm in a 10 kHz measurement bandwidth.
- iii) In general the ERP of noise on the spectrum more than 1MHz outside of the passband should not exceed -70dBm in a 10 kHz measurement bandwidth.

Whilst the pass band noise is greater than the -43dBm limit by approximately 11dB, the manufacturer has stated that they mitigate this by using good engineering practice as follows:-

Compliance with FCC deployment rule regarding the radiation of noise

Good engineering practice must be used in regard to the signal booster's noise radiation. Thus, the gain of the signal booster should be set so that the EIRP of the output noise from the signal booster should not exceed the level of -43 dBm in 10 kHz measurement bandwidth.

In the event that the noise level measured exceeds the aforementioned value, the signal booster gain should be decreased accordingly.

In general, the ERP of noise on a spectrum more than 1 MHz outside of the pass band should not exceed -70 dBm in a 10 kHz measurement bandwidth.

The D-SBR 3709S signal booster has a noise level of -49.38 dBm in 10 kHz measurement at 1 MHz spectrum outside the passband of the signal booster. It has an in-band noise level at around -32 dBm in a 10 kHz bandwidth Therefore the noise at the antenna input port should be calculated based on equation (3)

Equation (3) - Input Noise to service antenna

Input Noise to service antenna:

-43 dBm + Service Antenna gain – Antenna splitter losses in dB – cable loss in dBs

Example:

Signal booster connected to 10 service antennas with a 100m long ½ inch cable.

- *Losses of such a cable with the connectors = ~ 11dB.*
- *Gain = ~ 2 dBi*

Assuming 10 service antennas: antenna splitter losses = 11 dBi

Based on equation (3) Input antenna noise (to the antenna) = -49.38+2-11 -11=-69.38 dB .

The inband input noise to the antenna should be -32+2 -11-11= -52dbm

NOTE: in this example you may be required to add an external bandpass filter that would attenuate out of band noise by 1dB.

Conclusion:

Good engineering practice requires that in general when the out of band noise measured at the service antenna input is more than -70 dBm per 10 kHz measurement bandwidth, an external band pass filter should be added to attenuate the out of band noise level .

As per Part 90.219(e)(2) The noise figure of a signal booster must not exceed 9dB in either direction.

Max noise figure = 2.2642dB

Appendix C:**Additional Test and Sample Details**

This appendix contains details of:

1. The samples submitted for testing.
2. Details of EUT operating mode(s)
3. Details of EUT configuration(s) (see below).
4. EUT arrangement (see below).

Throughout testing, the following numbering system is used to identify the sample and it's modification state:

Sample No: Sxx Mod w

where:

xx	= sample number	eg. S01
w	= modification number	eg. Mod 2

The following terminology is used throughout the test report:

Support Equipment (SE) is any additional equipment required to exercise the EUT in the applicable operating mode. Where relevant SE is divided into two categories:

SE in test environment: The SE is positioned in the test environment and is not isolated from the EUT (e.g. on the table top during REFE testing).

SE isolated from the EUT: The SE is isolated via filtering from the EUT. (e.g. equipment placed externally to the ALSR during REFE testing).

EUT configuration refers to the internal set-up of the EUT. It may include for example:

- Positioning of cards in a chassis.
- Setting of any internal switches.
- Circuit board jumper settings.
- Alternative internal power supplies.

Where no change in EUT configuration is **possible**, the configuration is described as "single possible configuration".

EUT arrangement refers to the termination of EUT ports / connection of support equipment, and where relevant, the relative positioning of samples (EUT and SE) in the test environment.

For further details of the test procedures and general test set ups used during testing please refer to the related document "EMC Test Methods - An Overview", which can be supplied by TRaC Global upon request.

C1) Test samples

The following samples of the apparatus were submitted by the client for testing :

Sample No.	Description
S01	D-SBR 3709S (SMR 900 Digital Channel Selective and Band selective repeater)

Sample No.		
S01	Hardware revision number	B
S01	Software revision number	5.9.5

C2) EUT Operating Mode During Testing.

During testing, the EUT was exercised as described in the following tables :

Test	Description of Operating Mode:
All tests detailed in this report	EUT active, operating at maximum gain and output power

C3) EUT Configuration Information.

The EUT was submitted for testing in one single possible configuration.

C4) List of EUT Ports

The tables below describe the termination of EUT ports:

Sample : S01
Tests : Conducted

Port	Description of Cable Attached	Cable length	Equipment Connected
Network port	Ethernet Cable	3M	Test PC

Sample : S01
Tests : Radiated Emissions

Port	Description of Cable Attached	Cable length	Equipment Connected
Network port	Ethernet Cable	3M	Test PC
Power	Multi core	1.5m	AC Mains
Output ports	50 Ω Dummy Load	1.5m	N/A
Input ports	N-N coax cable	1.m	Signal generator

* Only connected during setup.
