General Product Information

Product Function and Intended Use

The equipment under test (EUT) is a RC toy car operating at 49.86MHz. The EUT moves forward, backward, left and right according to the command of the associate transmitter. The receiver can sound its horn and open the car door when it receives signal from the associate transmitter.

FCCID: NEX-9448-49RX

Model	Product description
9448	1:6 FF McLaren SLR

Circuit Description

- 1) Q1 and the associated circuit act as a RF-receiver.
- 2) Q2, Q3, IC1 and the associated circuit act an AF amplifier.
- 3) IC2, Q4 Q25 and the associated circuit act as a power amplifier.

Ratings and System Details

		Receiver
Frequency range	:	49.86MHz
Number of channels	:	1
Type of antenna	:	Fixed External Antenna
Power supply	:	9.6V rechargeable battery
Ports		none
Protection Class	:	III

Test Report No.: 14011129 001 Date: 30.08.2006 Page 5 of 9

TÜV Rheinland Group

Independent Operation Modes

The basic operation modes are:

- Power: On and Off
- Motor movement: left and right, forward and backward.

For further information refer to User Manual

Submitted Documents

The submitted documents are listed as follow:

- Circuit diagram
- Block diagram
- User manual
- Label artwork

Related Submittal(s) Grants

This is a single application for certification of the Receiver.

Test Set-up and Operation Mode

Principle of Configuration Selection

Emission: The equipment under test (EUT) was configured to measure its highest possible radiation

level. The test modes were adapted accordingly in reference to the instructions for use.

Test Operation and Test Software

Test operation should refer to test methodology.

- There was no special software to exercise the device.

Special Accessories and Auxiliary Equipment

The product has been tested together with the following additional accessories:

- none

Countermeasures to achieve EMC Compliance

The test sample, which has been tested, contained the noise suppression parts as described in the Circuit Diagram or the Technical Construction File. No additional measures were employed to achieve compliance.

Test Report No.: 14011129 001 Date: 30.08.2006 Page 7 of 9

Test Methodology

Radiated Emission

The radiated emission measurements were performed according to the procedures in ANSI C63.4-2003.

The equipment under test (EUT) was placed at the middle of the 80 cm height turntable, and the turntable is 3 meters far from the measuring antenna. During the testing, the EUT was operated standalone and arranged for maximum emissions. The EUT was tested in three orthogonal planes.

The investigation is performed with the EUT rotated 360 $^{\circ}$, the antenna height scanned between 1m and 4m, and the antenna rotated to repeat the measurements for both the horizontal and vertical antenna polarizations. Repeat the measurement steps until the maximum emissions were obtained.

All radiated tests were performed at an antenna to EUT with 3 meters distance, unless stated otherwise in section 7.1.1 and 7.1.2 of this test report.

Field Strength Calculation

The field strength at 3 m was established by adding the meter reading of the spectrum analyzer to the factors associated with antenna correction factor, cable loss, preamplifiers and filter attenuation.

The equation is expressed as follow:

FS = R + AF + CF + FA - PA

Where FS = Field Strength in dBuV/m at 3 meters.

R = Reading of Spectrum Analyzer in dBuV.

AF = Antenna Factor in dB.

CF = Cable Attenuation Factor in dB.

FA = Filter Attenuation Factor in dB.

PA = Preamplifier Factor in dB.

FA and PA are only be used for the measuring frequency above 1 GHz.

Test Report No.: 14011129 001 Date: 30.08.2006 Page 8 of 9

Test Results

Spurious Radiated Emissions

Section 15.109

RESULT: Pass

Test Specification : FCC Part 15 Section 15.109

Test Method : ANSI 63.4-2003

Measurement Location : Semi Anechoic Chamber

Measurement Distance : 3m

Detector Function : Quasi Peak
Measurement BW : 100 kHz
Supply Voltage : DC 9V
Measuring Frequency Range : 30-1000MHz
Mode of operation : Standby

Polarization: Vertical

Frequency	Field strength at 3m	Limit at 3m	Delta to Limit
(MHz)	(dBµV/m)	(dBµV/m)	(dB)
51.331	34.10	40.00	-5.90
106.400	31.50	43.52	-12.02
148.520	28.90	43.52	-14.62
200.000	31.20	43.52	-12.32

Polarization: Horizontal

Frequency	Field strength at 3m	Limit at 3m	Delta to Limit
(MHz)	(dBµV/m)	(dBµV/m)	(dB)
51.320	23.10	40.00	-16.90
97.160	36.70	43.52	-6.82
106.580	34.10	43.52	-9.42
197.480	34.00	43.52	-9.52
200.000	37.90	43.52	-5.62

The receiver was tested under receiving on mode. The spurious emissions are all complied with the limit.

Limit Section 15.109

The field strength of radiated emissions from unintentional radiators at a distance of 3 meters:

Frequency	Field strength	Field strength	Measurement distance (meters)
(MHz)	(μV/m)	(dBµV/m)	
30-88	100	20*log(100) = 40.00	3
88-216	150	20*log(150) = 43.52	3
216-960	200	20*log(200) = 46.02	3
Above 960	500	20*log(500) = 53.98	3

Test Report No.: 14011129 001 Date: 30.08.2006 Page 9 of 9
