1 TEST STANDARDS

The tests were performed according to following standards:

FCC Rules and Regulations Part 15 Subpart C- Intentional Radiators (October 01, 2009)

Part 15, Subpart C, Section 15.209

Radiated emissions, general requirements

mikes-testingpartners gmbh Ohmstrasse 2-4 · 94342 STRASSKIRCHEN · GERMANY Tel.:+49(0)9424-94810 · Fax:+49(0)9424-9481240 File No. T32539-06-00KG, page 3 of 20

2 SUMMARY

GENERAL REMARKS:

None

FINAL ASSESSMENT:

The equipment under test fulfills the EMI requirements cited in clause 1 test standards.

Date of receipt of test sample

: acc. to storage records

3 EQUIPMENT UNDER TEST

3.1 Power supply system utilised

Power supply voltage : 12 V / DC

3.2 Short description of the Equipment under Test (EuT)

The Smart LF Oscillator TMLF8-9 is a transmitter installed in a motor vehicle and is used as part of the Smart System. In the System, the Smart LF Oscillator has mainly following functions:

- Smart Door Unlocking Door anntenas transmit a low frequency at 134.2 kHz intermittently. An electronic key, carried by the driver, will transmit a high radio wave when recognized the signal.
- Smart Trunk Unlocking The trunk antenna provides the signal for the electronic key to open the trunk.
 Detection of Electronic Key inside Trunk.
- Detection of Electronic Key inside Trunk. If the driver tries to close the trunk, the inside trunk antenna transmit a radio wave of 134.2 KHz. The key left inside the trunk will recognize the signal and transmits a high radio frequency back to alarm the driver.
- Smart Engine Start

When the driver is inside the car the inside Room Antenna transmits a radio wave of 134.2 kHz. If the electronic key recognize the signal it transmits a high radio frequency back to trigger the engine start mechanism.

The tests were performed on three antenna types in conjunction with Computer Assy (ECU):

- 1. Door antenna
- 2. Room antenna / Luggage antenna
- 3. Trunk antenna

Number of tested samples:

EuT operation mode:

The equipment under test was operated during the measurement under the following conditions:

- Transmit mode CW (unmodulated)

- Transmit mode modulated

EuT configuration:

(The CDF filled by the applicant can be viewed at the test laboratory.)

The following peripheral devices and interface cables were connected during the measurements:

| - | Test box | Model : Supplied by the | manufacturer |
|---|---------------|-------------------------|--------------|
| - | Door antenna | Model : 8DA | |
| - | Room antenna | Model : 8RA | |
| - | Trunk antenna | Model : 8TB | |
| - | | Model : | |
| | | | |

File No. T32539-06-00KG, page 5 of 20

4 TEST ENVIRONMENT

4.1 Address of the test laboratory

mikes-testingpartners gmbh Ohmstrasse 2-4 94342 STRASSKIRCHEN GERMANY

4.2 Environmental conditions

During the measurement the environmental conditions were within the listed ranges:

| Temperature: | 15-35 ° C |
|-----------------------|------------|
| Humidity: | 30-60 % |
| Atmospheric pressure: | 86-106 kPa |

4.3 Statement of the measurement uncertainty

The data and results referenced in this document are true and accurate. The reader may notice that tolerances within the calibration of the equipment and facilities may cause additional uncertainty. The measurement uncertainty is calculated for all measurements listed in this test report acc. to CISPR 16-4-2 "Uncertainties, statistics and limit modelling – Uncertainty in EMC measurement" and documented in the mikes-testingpartners gmbh quality system acc. to DIN EN ISO/IEC 17025. For all measurements shown in this report, the measurement uncertainty of the test laboratory, mikes-testingpartners gmbh, is below the measurement uncertainty as defined by CISPR. Therefore, no special measures must be taken into consideration with regard to the limits according to CISPR. Furthermore, component diversity and modifications in production process of devices may result in additional deviation. If necessary, refer to the test lab for the actual measurement uncertainty for the specific test. The manufacturer has the sole responsibility of continued compliance of the EUT.

4.4 Measurement Protocol for FCC, VCCI and AUSTEL

4.4.1 GENERAL INFORMATION

4.4.1.1 <u>Test Methodology</u>

Conducted and radiated disturbance testing is performed according to the procedures set out by the International Special Committee on Radio Interference (CISPR) Publication 22, European Standard EN 55022 as shown under section 1 of this report.

The test methods used comply with CISPR Publication 22, EN 55022 - "Information technology equipment - Radio disturbance characteristics - Limits and methods of measurement" and with ANSI C63.4 - "Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz."

In compliance with 47 CFR Part 15 Subpart A Section 15.38 testing for FCC compliance may be done following the ANSI C63.4-2009 procedures and using the CISPR 22 Limits.

4.4.1.2 Justification

The Equipment Under Test (EUT) is configured in a typical user arrangement in accordance with the manufacturer's instructions. A cable is connected to each available port and either terminated with a peripheral using the appropriate impedance characteristic or left unterminated. Where appropriate, cables are manually manipulated with respect to each other thus obtaining maximum disturbances from the unit.

5 TEST CONDITIONS AND RESULTS

5.1 Conducted emissions

For test instruments and accessories used see section 6 Part A 4.

5.1.1 Description of the test location

Test location: None

5.1.2 Photo documentation of the test set-up

5.1.3 Description of Measurement

The final level, expressed in $dB\mu V$, is arrived at by taking the reading directly from the EMI receiver. This level is compared directly to the FCC Limit or to the CISPR limit.

To convert between $dB\mu V$ and μV , the following conversions apply:

 $dB\mu V = 20(\log \mu V)$ $\mu V = Inverse \log(dB\mu V/20)$

Conducted emissions on the 50 Hz and/or 60 Hz power interface of the EuT are measured in the frequency range of 150 kHz to 30 MHz. The measurements are performed using a receiver, which has CISPR characteristic bandwidth and quasi-peak detection and a Line Impedance Stabilization Network (LISN) with $50\Omega/50 \mu$ H (CISPR 16) characteristics. Table top equipment is placed on a non-conducting table 80 centimeters above the floor and is positioned 40 centimeters from the vertical ground plane (wall) of the screen room. If the minimum limit margin appears to be less than 20 dB with a peak mode measurement, the emissions are remeasured using a tuned receiver with quasi-peak and average detection and recorded on the data sheets.

5.1.4 Test result

Frequency range:

0.15 MHz - 30 MHz

Min. limit margin

Remarks: The test is not applicable because the EuT is battery powered.

File No. T32539-06-00KG, page 8 of 20

5.2 Field strength of the fundamental wave

For test instruments and accessories used see section 6 Part CPR 1.

5.2.1 Description of the test location

| Test location: | OATS1 |
|----------------|----------|
| Test distance: | 3 metres |

5.2.2 Photo documentation of the test set-up

mikes-testingpartners gmbh Ohmstrasse 2-4 · 94342 STRASSKIRCHEN · GERMANY Tel.:+49(0)9424-94810 · Fax:+49(0)9424-9481240 File No. T32539-06-00KG, page 9 of 20

5.2.3 Description of Measurement

The magnetic field strength from the EuT will be measured on an open area test site in the frequency range of 9 kHz to 30 MHz using a tuned receiver and a shielded loop antenna. The set up of the Equipment under test will be in accordance to ANSI C63.4-2009. The antenna was positioned 3, 10 or 30 meters horizontally from the EuT. Measurements have been made in all three orthogonal axes and the shielded loop antenna was rotated to locate the maximum of the emissions. In the case where larger measuring distances are required the results will extrapolated based on the values measured on the closer distances according to Section 15.31 (f) (2) [2]. The final measurement will be performed with an EMI Receiver set to Quasi Peak detector except for the frequency bands 9 kHz to 90 kHz and 110 to 490 kHz where an average detector will be used according to Section 15.209 (d) [2].

The final level, expressed in $dB\mu V/m$, is arrived at by taking the reading from the EMI receiver (Level $dB\mu V$) and adding the antenna correction factor and cable loss factor (Factor dB) to it. This result then has to be compared with the relevant FCC limit.

The resolution bandwidth during the measurement is as follows:

9 kHz – 150 kHz: ResBW: 200 Hz 150 kHz – 30 MHz: ResBW: 9 kHz

.....

Example:

| Frequency | Level | + | Factor | = Level | Limit | = | Delta |
|-----------|--------|---|--------|----------|----------|---|-------|
| (MHz) | (dBµV) | | (dB) | (dBµV/m) | (dBµV/m) | | (dB) |
| 1.705 | 5 | + | 20 | = 25 | 30 | = | 5 |

5.3.3 Description of Measurement

The spurious emissions from the EuT will be measured on an open area test site in the frequency range of 9 kHz to 30 MHz using a tuned receiver and a shielded loop antenna. The antenna was positioned 3, 10 or 30 meters horizontally from the EuT. Measurements have been made in all three orthogonal axes and the shielded loop antenna was rotated to locate the maximum of the emissions. In the case where larger measuring distances are required the results will extrapolated based on the values measured on the closer distances according to Section 15.31 (f) (2) [2]. The final measurement will be performed with an EMI Receiver set to Quasi Peak detector except for the frequency bands 9 kHz to 90 kHz and 110 to 490 kHz where an average detector will be used according to Section 15.209 (d) [2].

The final level, expressed in $dB\mu V/m$, is arrived at by taking the reading from the EMI receiver (Level $dB\mu V$) and adding the antenna correction factor and cable loss factor (Factor dB) to it. This result then has to be compared with the relevant FCC limit.

The resolution bandwidth during the measurement is as follows:

9 kHz – 150 kHz: ResBW: 200 Hz 150 kHz – 30 MHz: ResBW: 9 kHz

5.4.3 Description of Measurement

Spurious emissions from the EuT are measured in the frequency range of 30 MHz to 1000 MHz using a tuned receiver and appropriate broadband linearly polarized antennas. Measurements between 30 MHz and 1000 MHz are made with 120 kHz/6 dB bandwidth and quasi-peak detection. Table top equipment is placed on a 1.0 X 1.5 meter non-conducting table 80 centimetres above the ground plane. Floor standing equipment is placed directly on the turntable/ground plane. The set up of the Equipment under test will be in accordance to ANSI C63.4-2009. The Interface cables that are closer than 40 centimetres from the ground plane. Cables to simulators/testers (if used in this test) are routed through the center of the table and to a screen room located outside the test area. The antenna was positioned 3, 10 or 30 meters horizontally from the EuT. To locate maximum emissions from the test sample the antenna is varied in height from 1 to 4 meters, measurement scans are made with both horizontal and vertical antenna polarization`s and the EuT are rotated 360 degrees.

The final level, expressed in $dB\mu V/m$, is arrived by taking the reading from the EMI receiver (Level $dB\mu V$) and adding the correction factors and cable loss factor (Factor dB) to it. This is done automatically in the EMI receiver, where the correction factors are stored. This result then has the FCC or CISPR limit subtracted from it to provide the Delta which gives the tabular data as shown in the data sheets at page.

The resolution bandwidth during the measurement is as follows:30 MHz - 1000 MHz:ResBW: 120 kHz

Example:

| 0. | | | | | | | | | |
|-----------|--------|---|--------|---|----------|----------|---|-------|--|
| Frequency | Level | + | Factor | = | Level | Limit | = | Delta | |
| (MHz) | (dBµV) | | (dB) | | (dBµV/m) | (dBµV/m) | | (dB) | |
| 719 | 75 | + | 32.6 | = | 107.6 | 110 | = | -2.4 | |
| | | | | | | | | | |

5.4.4 Test result

Door antenna, Room antenna, Trunk antenna
