# Test Setup Diagram

SG 64 uses analog RF signal generators to emit EM waves from the probe array to the antenna under test (AUT) or vice versa.

It uses the NPAC as an RF receiver for antenna measurements. The NPAC also drives the electronic scanning of the probe array.

The NPAC includes the fastest and most accurate sources and receivers on the market.

## Note:

1. Satimo runs annual maintenance on the WNC's SG64 Chamber, including all equipment on the list, and completed this round of maintenance in June.
2. There are 63 set ANT probes in WNC's SG64 Chamber.

# Test Setup and Procedure

- Place the device at the center of the chamber.
- Connect the antenna cable to RF cable of the chamber
- Run Satimo test SW (**NPAC Spherical Measurement, v1.5.4 (GIT-E6965664)**)
- Get 3D data in 2.8125 degree step from phi  $0^{\circ}\sim 360^{\circ}$  and theta  $-90^{\circ}\sim +90^{\circ}$ , including efficiency, peak gain, 2D & 3D radiation pattern.
- This is far field test for XBB BLE antenna verification.
- This is passive measurement, which means the device is off and not in any operating mode.

# Summary
