Tim,

The customer told me that they use DH1 packet.

But I got some questions regarding to the protocol of BlueTooth.

You have mentioned that DH1 is one slot (0.625ms) in 49ms, so the duty cycle is  $20\log(0.625/49)$ . But why DH5 is  $0.625*5$  in 247ms ? And the most strange point is that its duty cycle is  $20\log(3.125/100)$  ??? Where did you get the " 100 " in this calculation ? Can you please comment ?

Best Regards,
