

DICKIE, Modul 49001TX

## Circuit Description

(With reference to Circuit Diagram and Blockdiagram)

The circuit of modul 49001TX is basically divided in four parts:

1. Oszillator (carrier frequency)
2. Modulation of signal
3. RF amplifier
4. Output circuit with antenna

The Oszillator unit produces an carrier frequency of 49,861 MHz by using a quartz crystal, which is coupled via a transistor.

The modulation is gained by an analog circuit, beeing operated by the user trough a switch.

The output circuit, beeing realised by capacitors and inductances matches the RF amplifier to the antenna providing RF-power being transfered to the antenna.
