# Calibration Laboratory of Schmid & Partner

Engineering AG Zeughausstrasse 43, 8004 Zurich, Switzerland

S Schweizerischer Kalibrierdienst
C Service suisse d'étalonnage
Servizio svizzero di taratura
S Swiss Calibration Service

Accreditation No.: SCS 108

Accredited by the Swiss Federal Office of Metrology and Accreditation
The Swiss Accreditation Service is one of the signatories to the EA
Multilateral Agreement for the recognition of calibration certificates

#### Glossary:

TSL tissue simulating liquid

ConvF sensitivity in TSL / NORM x,y,z N/A not applicable or not measured

# Calibration is Performed According to the Following Standards:

- a) IEEE Std 1528-2003, "IEEE Recommended Practice for Determining the Peak Spatial-Averaged Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques", December 2003
- b) CENELEC EN 50361, "Basic standard for the measurement of Specific Absorption Rate related to human exposure to electromagnetic fields from mobile phones (300 MHz - 3 GHz), July 2001
- c) Federal Communications Commission Office of Engineering & Technology (FCC OET), "Evaluating Compliance with FCC Guidelines for Human Exposure to Radiofrequency Electromagnetic Fields; Additional Information for Evaluating Compliance of Mobile and Portable Devices with FCC Limits for Human Exposure to Radiofrequency Emissions", Supplement C (Edition 01-01) to Bulletin 65

# Additional Documentation:

d) DASY4 System Handbook

# Methods Applied and Interpretation of Parameters:

- Measurement Conditions: Further details are available from the Validation Report at the end
  of the certificate. All figures stated in the certificate are valid at the frequency indicated.
- Antenna Parameters with TSL: The dipole is mounted with the spacer to position its feed point exactly below the center marking of the flat phantom section, with the arms oriented parallel to the body axis.
- Feed Point Impedance and Return Loss: These parameters are measured with the dipole
  positioned under the liquid filled phantom. The impedance stated is transformed from the
  measurement at the SMA connector to the feed point. The Return Loss ensures low
  reflected power. No uncertainty required.
- Electrical Delay: One-way delay between the SMA connector and the antenna feed point. No uncertainty required.
- SAR measured: SAR measured at the stated antenna input power.
- SAR normalized: SAR as measured, normalized to an input power of 1 W at the antenna connector.
- SAR for nominal TSL parameters: The measured TSL parameters are used to calculate the nominal SAR result.

Certificate No: D835V2-499 Mar06

<sup>&</sup>lt;sup>2</sup> Correction to nominal TSL parameters according to d), chapter "SAR Sensitivities"

# Appendix

### Antenna Parameters with Head TSL

| Impedance, transformed to feed point | 52.1 Ω - 2.9 jΩ |
|--------------------------------------|-----------------|
| Return Loss                          | - 29.1 dB       |

# Antenna Parameters with Body TSL

| Impedance, transformed to feed point | 47.9 Ω - 5.1 jΩ |
|--------------------------------------|-----------------|
| Return Loss                          | - 24.9 dB       |

# General Antenna Parameters and Design

| Electrical Delay (one direction)   | 1.391ns |
|--|---------|
| The second secon |         |

After long term use with 100W radiated power, only a slight warming of the dipole near the feedpoint can be measured.

The dipole is made of standard semirigid coaxial cable. The center conductor of the feeding line is directly connected to the second arm of the dipole. The antenna is therefore short-circuited for DC-signals.

No excessive force must be applied to the dipole arms, because they might bend or the soldered connections near the feedpoint may be damaged.

### Additional EUT Data

| Manufactured by | SPEAG         |

#### DASY4 Validation Report for Head TSL

Date/Time: 15.03.2006 12:51:44

Test Laboratory: SPEAG, Zurich, Switzerland

DUT: Dipole 835 MHz; Type: D835V2; Serial: D835V2 - SN:499

Communication System: CW; Frequency: 835 MHz; Duty Cycle: 1:1

Medium: HSL U10 BB;

Medium parameters used: f = 835 MHz;  $\sigma = 0.942$  mho/m;  $\epsilon_r = 42.1$ ;  $\rho = 1000$  kg/m<sup>3</sup>

Phantom section: Flat Section

Measurement Standard: DASY4 (High Precision Assessment)

#### DASY4 Configuration:

- Probe: ET3DV6 SN1507 (HF); ConvF(6.09, 6.09, 6.09); Calibrated: 28.10.2005
- · Sensor-Surface: 4mm (Mechanical Surface Detection)
- · Electronics: DAE4 Sn601; Calibrated: 15.12.2005
- · Phantom: Flat Phantom 4.9L; Type: QD000P49AA; ;
- Measurement SW: DASY4, V4.7 Build 14; Postprocessing SW: SEMCAD, V1.8 Build 165

Pin = 250 mW; d = 10 mm/Area Scan (71x81x1): Measurement grid: dx=15mm, dy=15mm Maximum value of SAR (interpolated) = 2.54 mW/g

Pin = 250 mW; d = 10 mm/Zoom Scan (7x7x7)/Cube 0: Measurement grid: dx=5mm, dy=5mm, dz=5mm

Reference Value = 53.7 V/m; Power Drift = -0.008 dB

Peak SAR (extrapolated) = 3'.53 W/kg

SAR(1 g) = 2.35 mW/g; SAR(10 g) = 1.53 mW/g

Maximum value of SAR (measured) = 2.55 mW/g

Certificate No: D835V2-499\_Mar06

<sup>&</sup>lt;sup>2</sup> Correction to nominal TSL parameters according to d), chapter "SAR Sensitivities"

# Appendix

# Antenna Parameters with Head TSL

| Impedance, transformed to feed point | 53.5 Ω + 5.1 jΩ |
|--------------------------------------|-----------------|
| Return Loss                          | - 24.8 dB       |

# Antenna Parameters with Body TSL

| Impedance, transformed to feed point | $47.9 \Omega + 6.3 J\Omega$ |
|--------------------------------------|-----------------------------|
| Return Loss                          | - 23.4 dB                   |

# General Antenna Parameters and Design

| Electrical Delay (one direction) | 1.200 ns |  |
|----------------------------------|----------|--|
|----------------------------------|----------|--|

After long term use with 100W radiated power, only a slight warming of the dipole near the feedpoint can be measured.

The dipole is made of standard semirigid coaxial cable. The center conductor of the feeding line is directly connected to the second arm of the dipole. The antenna is therefore short-circuited for DC-signals.

No excessive force must be applied to the dipole arms, because they might bend or the soldered connections near the

feedpoint may be damaged.

### Calibration is Performed According to the Following Standards:

- a) IEEE Std 1528-2003, "IEEE Recommended Practice for Determining the Peak Spatial-Averaged Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques", December 2003
- b) CENELEC EN 50361, "Basic standard for the measurement of Specific Absorption Rate related to human exposure to electromagnetic fields from mobile phones (300 MHz - 3 GHz), July 2001
- c) Federal Communications Commission Office of Engineering & Technology (FCC OET), "Evaluating Compliance with FCC Guidelines for Human Exposure to Radiofrequency Electromagnetic Fields; Additional Information for Evaluating Compliance of Mobile and Portable Devices with FCC Limits for Human Exposure to Radiofrequency Emissions", Supplement C (Edition 01-01) to Bulletin 65

# Additional Documentation:

d) DASY4 System Handbook

### Methods Applied and Interpretation of Parameters:

- Measurement Conditions: Further details are available from the Validation Report at the end
  of the certificate. All figures stated in the certificate are valid at the frequency indicated.
- Antenna Parameters with TSL: The dipole is mounted with the spacer to position its feed
  point exactly below the center marking of the flat phantom section, with the arms oriented
  parallel to the body axis.
- Feed Point Impedance and Return Loss: These parameters are measured with the dipole
  positioned under the liquid filled phantom. The impedance stated is transformed from the
  measurement at the SMA connector to the feed point. The Return Loss ensures low
  reflected power. No uncertainty required.
- Electrical Delay: One-way delay between the SMA connector and the antenna feed point.
   No uncertainty required.
- SAR measured; SAR measured at the stated antenna input power.
- SAR normalized: SAR as measured, normalized to an input power of 1 W at the antenna connector.
- SAR for nominal TSL parameters: The measured TSL parameters are used to calculate the nominal SAR result.

Certificate No: D2450V2-735\_Jul05

### Appendix

# Antenna Parameters with Head TSL

| Impedance, transformed to feed point | 53.6 \( \Omega + 3.7 \) (\Omega \) |  |
|--------------------------------------|------------------------------------|--|
| Return Loss                          | -26.0 dB                           |  |

# Antenna Parameters with Body TSL

| impedance, transformed to feed point | 49.9 Ω + 5.3 jΩ |  |
|--------------------------------------|-----------------|--|
| Return Loss                          | - 25.5 dB       |  |

# General Antenna Parameters and Design

| 1.157 ns |
|----------|
|          |

After long term use with 100W radiated power, only a slight warming of the dipole near the feedpoint can be measured.

The dipole is made of standard semirigid coaxial cable. The center conductor of the feeding line is directly connected to the second arm of the cipole. The antenna is therefore short-circuited for DC-signals.

No excessive force must be applied to the dipole arms, because they might bend or the soldered connections near the feedpoint may be damaged.

Medium: MSL 2450

Medium parameters used: f = 2450 MHz;  $\sigma = 2.02$  mho/m;  $\varepsilon_r = 52.5$ ;  $\rho = 1000$  kg/m<sup>3</sup>

Phantom section: Flat Section

Measurement Standard: DASY4 (High Precision Assessment)

### DASY4 Configuration:

- Probe: ES3DV2 SN3025; ConvF(4.13, 4.13, 4.13); Calibrated: 29.10.2004
- Sensor-Surface: 4mm (Mechanical Surface Detection)
- Electronics: DAE4 Sn601; Calibrated: 22.07.2004
- Phantom: Flat Phantom 5.0 (front); Type: QD000P50AA
- Measurement SW: DASY4, V4.6 Build 4; Postprocessing SW: SEMCAD, V1.8 Build 149

#### Pin = 250 mW; d = 10 mm/Area Scan (81x81x1):

Measurement grid: dx=15mm, dy=15mm

Maximum value of SAR (interpolated) = 15.8 mW/g

# Pin = 250 mW; d = 10 mm/Zoom Scan (7x7x7)/Cube 0:

Measurement grid: dx-5mm, dy-5mm, dz-5mm

Reference Value = 85.9 V/m; Power Drift = 0.160 dB

Peak SAR (extrapolated) = 27.6 W/kg

# SAR(1 g) = 13.5 mW/g; SAR(10 g) = 6.26 mW/g.

Maximum value of SAR (measured) = 15.5 mW/g

Glossary:

TSL tissue simulating liquid NORMx,y,z sensitivity in free space

ConF sensitivity in TSL / NORMx,y,z
DCP diode compression point
Polarization φ rotation around probe axis

Polarization 9 9 rotation around an axis that is in the plane normal to probe axis (at

measurement center), i.e., 9 = 0 is normal to probe axis

### Calibration is Performed According to the Following Standards:

 a) IEEE Std 1528-2003, "IEEE Recommended Practice for Determining the Peak Spatial-Averaged Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques", December 2003

 b) CENELEC EN 50361, "Basic standard for the measurement of Specific Absorption Rate related to human exposure to electromagnetic fields from mobile phones (300 MHz - 3 GHz), July 2001

# Methods Applied and Interpretation of Parameters:

- NORMx,y,z: Assessed for E-field polarization 9 = 0 (f ≤ 900 MHz in TEM-cell; f > 1800 MHz: R22 waveguide). NORMx,y,z are only intermediate values, i.e., the uncertainties of NORMx,y,z does not effect the E²-field uncertainty inside TSL (see below ConvF).
- NORM(f)x,y,z = NORMx,y,z \* frequency\_response (see Frequency Response Charl). This
  linearization is implemented in DASY4 software versions later than 4.2. The uncertainty of
  the frequency response is included in the stated uncertainty of ConvF.
- DCPx,y,z: DCP are numerical linearization parameters assessed based on the data of power sweep (no uncertainty required). DCP does not depend on frequency nor media.
- ConvF and Boundary Effect Parameters: Assessed in flat phantom using E-field (or Temperature Transfer Standard for f ≤ 800 MHz) and inside waveguide using analytical field distributions based on power measurements for f > 800 MHz. The same setups are used for assessment of the parameters applied for boundary compensation (alpha, depth) of which typical uncertainty values are given. These parameters are used in DASY4 software to improve probe accuracy close to the boundary. The sensitivity in TSL corresponds to NORMx,y,z \* ConvF whereby the uncertainty corresponds to that given for ConvF. A frequency dependent ConvF is used in DASY version 4.4 and higher which allows extending the validity from ± 50 MHz to ± 100 MHz.
- Spherical isotropy (3D deviation from isotropy): in a field of low gradients realized using a
  flat phantom exposed by a patch antenna.
- Sensor Offset: The sensor offset corresponds to the offset of virtual measurement center from the probe tip (on probe axis). No tolerance required.

### Glossary

DAE data acquisition electronics

Connector angle information used in DASY system to align probe sensor X to the robot

coordinate system.

#### Methods Applied and Interpretation of Parameters

- DC Voltage Measurement: Calibration Factor assessed for use in DASY system by comparison with a calibrated instrument traceable to national standards. The figure given corresponds to the full scale range of the voltmeter in the respective range.
- Connector angle: The angle of the connector is assessed measuring the angle mechanically by a tool inserted. Uncertainty is not required.
- The following parameters contain technical information as a result from the performance test and require no uncertainty.
- DC Voltage Measurement Linearity: Verification of the Linearity at +10% and -10% of the nominal calibration voltage. Influence of offset voltage is included in this measurement.
- Common mode sensitivity: Influence of a positive or negative common mode voltage on the differential measurement.
- Channel separation; Influence of a voltage on the neighbor channels not subject to an input voltage.
- AD Converter Values with inputs shorted: Values on the Internal AD converter corresponding to zero input voltage
- Input Offset Measurement: Output voltage and statistical results over a large number of zero voltage measurements.
- Input Offset Current: Typical value for information; Maximum channel input offset current, not considering the input resistance.
- Input resistance: DAE input resistance at the connector, during internal auto-zeroing and during measurement.
- Low Battery Alarm Voltage: Typical value for information. Below this voltage, a battery alarm signal is generated.
- Power consumption: Typical value for Information. Supply currents in various operating modes.

# Appendix D - WCDMA Test Mode

# 1. Conducted Output Power

RMC 144 kbps is the main WCDMA test mode for both EMC and SAR reports. A detailed analysis of the output power for all WCDMA modes is provided in the table below. The EUT supports DPDCH1 and HSDPA with a various of data rates, such as 12.2Kbps, 64kbps, 144Kbps and 384Kbps.

|              | Symbol  |    |   |      | Reference Band II |         |         |         | Band V  |         |         |
|--------------|---|----|---|------|-------------------|---------|---------|---------|---------|---------|---------|
| Mode         | Rates   | SF | K | Data | Channel Type      | Ch 9262 | Ch 9400 | Ch 9538 | Ch 4132 | Ch 4182 | Ch 4233 |
|              | (Kbps)  |    |   |      | (Data Rates)      | 1852.4  | 1880.0  | 1907.6  | 826.4   | 836.4   | 846.6   |
| DPDCH1       | 60  | 64 | 2 | 40   | RMC 12.2 Kbps     | 23.12   | 23.36   | 23.63   | 23.91   | 23.87   | 23.94   |
|              | 240   | 16 | 4 | 160  | RMC 64 Kbps       | 22.94   | 23.49   | 23.59   | 23.91   | 23.92   | 23.89   |
|              | 480   | 8  | 5 | 320  | RMC 144 Kbps      | 23.10   | 23.15   | 23.68   | 23.93   | 23.81   | 23.96   |
|              | 960   | 4  | 6 | 640  | RMC 384 Kbps      | 23.28   | 23.13   | 23.47   | 23.92   | 23.81   | 23.88   |

| Data : Bits/ | Data: Bits/Slot; SF: Spreading Factor; K: Number of bits per uplink DPDCH slot. |    |   |      |                   |         |         |         |         |         |         |

**Table 1 Conducted output power** 

# Followed by FCC suggestions[1]:

Frame structure for uplink DPDCH/DPCCH

The parameter K in the figure determines the number of bits per uplink DPDCH slot. It is related to the spreading factor SF of the DPDCH as  $SF = 256/2^k$ . The DPDCH spreading factor may range from 256 down to 4. The spreading factor of the uplink DPCCH is always equal to 256, i.e. there are 10 bits per uplink DPCCH slot.

|                    | Channel Bit<br>Rate (kbps) | Channel<br>Symbol Rate<br>(ksps) | Spreading<br>Factor | Spreading<br>Code Number | Bits/Slot |
|--------------------|----------------------------|----------------------------------|---------------------|--------------------------|-----------|
| DPCCH              | 15                         | 15                               | 256                 | 0                        | 10        |
|                    | 15                         | 15                               | 256                 | 64                       | 10        |

| DPDCH <sub>n</sub> | 960                        | 960                              | 4                   | 1, 2, 3                  | 640       |

**Table 2 DPCCH and DPDCH** 

There is only one DPCCH per radio link. Data rates, channelization codes and spread factor information for DPCCH and DPDCH<sub>n</sub> are indicated in the following Table. Spreading Rate (SF) \* Symbol Rate = 3.84 Mcps.

# 2. WCDMA Setup Configuration

- I. The EUT was connected to Spectrum Analyzer and Base Station via power splitter. Refer to the drawing of Setup Configuration.
- II. The RF path losses was compensated into the measurements.
- III. A call was established between EUT and Base Station with following setting
  - a. Data rates: Varied RMC for each measurements.
  - b. TPC with All Up
- IV. The transmitted maximum output power was recorded.

**Setup Configuration** 

Single DPCCH with only one DPDCH at RMC 12.2Kbps (Symbol Rate 60 Kbps)

TPC with All "1" (Continuous transmitting)

# 3. HSDPA Setup Configuration

- I. The EUT was connected to Spectrum Analyzer and Base Station via power splitter. Refer to the drawing of Setup Configuration.
- II. The RF path losses was compensated into the measurements.
- III. A call was established between EUT and Base Station with following setting:
  - a. Set RMC12.2Kbps with HSDPA mode.
  - b. TPC with All Up with H-set.
- IV. The transmitted maximum output power was recorded.

**Setup Configuration** 

RMC 12.2Kbps with HSDPA function
