

# Specific Absorption Rate (SAR) Test Report

for  
**HTC Corporation**  
on the  
**Pocket PC Phone**

**Report Number** : FA920507-01B  
**Model Name** : CEDA100  
**FCC ID** : NM8CEDA100  
**Date of Testing** : Feb. 23, 2009  
**Issued Date of Report** : Mar. 13, 2009

- The test results refer exclusively to the tested model/sample only.
- Without written approval of SPORTON INTERNATIONAL INC., the test report shall not be reproduced except in full.
- Report Version: Rev. 01

## **SPORTON INTERNATIONAL INC.**

**No. 52, Hwa Ya 1<sup>st</sup> Rd., Hwa Ya Technology Park, Kwei-Shan Hsiang, Tao Yuan Hsien, Taiwan, R.O.C.**

**1. Statement of Compliance**

The Specific Absorption Rate (SAR) maximum results found during testing for the **HTC Corporation Pocket PC Phone CEDA100** are as follows (with expanded uncertainty 21.9%):

Band	Position	SAR (W/kg)
802.11b/g	Head	0.256
	Body	0.192
Bluetooth	Head	N/A
	Body	N/A

They are in compliance with Specific Absorption Rate (SAR) for general population/uncontrolled exposure limits specified in FCC 47 CFR part 2 (2.1093) and ANSI/IEEE C95.1-1999 and had been tested in accordance with the measurement methods and procedures specified in IEEE P1528-2003 and OET Bulletin 65 Supplement C (Edition 01-01).

Approved by

Roy Wu  
Manager

## **2. Administration Data**

### **2.1 Testing Laboratory**

**Company Name :** Sporton International Inc.  
**Address :** No. 52, Hwa-Ya 1<sup>st</sup> RD., Hwa Ya Technology Park, Kwei-Shan Hsiang, TaoYuan Hsien, Taiwan, R.O.C.  
**Test Site :** SAR01-HY  
**Telephone Number :** 886-3-327-3456  
**Fax Number :** 886-3-328-4978

### **2.2 Applicant**

**Company Name :** HTC Corporation  
**Address :** No. 23, Xinghua Rd., Taoyuan City, Taiwan

### **2.3 Manufacturer**

**Company Name :** HTC Corporation  
**Address :** 1F, No. 6-3, Baoqiang Rd., Xindian City, Taipei County, Taiwan

### **2.4 Application Details**

**Date of reception of application:** Feb. 05, 2009  
**Start of test :** Feb. 23, 2009  
**End of test :** Feb. 23, 2009

**3. General Information**

**3.1 Description of Device Under Test (DUT)**

Product Feature & Specification	
DUT Type	Pocket PC Phone
Model Name	CEDA100
FCC ID	NM8CEDA100
Tx/Rx Frequency Range	2400 MHz ~ 2483.5 MHz
Maximum Output Power to Antenna	802.11b : 16.57 dBm 802.11g : 13.19 dBm Bluetooth : 2.54 dBm
Antenna Type	Shorting Monopole Antenna
Type of Modulation	802.11b : DSSS 802.11g : OFDM Bluetooth : GFSK
DUT Stage	Production Unit

**3.2 Product Photos**

Refer to Appendix D.

**3.3 Applied Standards**

The Specific Absorption Rate (SAR) testing specification, method and procedure for this Pocket PC Phone is in accordance with the following standards:

- 47 CFR Part 2 (2.1093)
- IEEE C95.1-1999
- IEEE P1528-2003
- OET Bulletin 65 Supplement C (Edition 01-01)
- KDB 248227 r1.2
- KDB 648474 D01 v01r05

**3.4 Device Category and SAR Limits**

This device belongs to portable device category because its radiating structure is allowed to be used within 20 centimeters of the body of the user. Limit for General Population/Uncontrolled exposure should be applied for this device, it is 1.6 W/kg as averaged over any 1 gram of tissue.

3.5 Test Conditions

3.5.1 Ambient Condition

Ambient Temperature	20-24
Humidity	<60 %

3.5.2 Test Configuration

For WLAN link mode, engineering testing software installed on the EUT can provide continuous transmitting RF signal. This RF signal utilized in SAR measurement has almost 100% duty cycle and its crest factor is 1.

According to the unlicensed transmitters of KDB 648474,

- test highest output channel only if SAR is 0.8 W/kg
- test all required channels if SAR is > 0.8 W/kg

For WLAN and Bluetooth, simultaneous transmission SAR is not required because WLAN and Bluetooth share the same antenna and simultaneous transmission overlapping transmissions handoff time is less than 30s. Bluetooth standalone SAR is not required because it share the same antenna with WLAN and has much lower power than WLAN.

The data rates for WLAN and Bluetooth SAR testing were set in 1Mbps for 802.11b and 6Mbps for 802.11g due to the highest RF output power. Power tables of 802.11b/g are as below:

<802.11b>

Channel	Frequency (MHz)	RF Power (dBm)			
		2.4GHz 802.11b Data Rate			
		1 Mbps	2 Mbps	5.5 Mbps	11 Mbps
CH 01	2412 MHz	16.57	16.34	16.23	16.14
CH 06	2437 MHz	16.17	16.12	16.18	16.24
CH 11	2462 MHz	16.24	16.22	16.43	16.45

<802.11g>

Channel	Frequency (MHz)	RF Power (dBm)							
		2.4GHz 802.11g Data Rate							
		6 Mbps	9 Mbps	12 Mbps	18 Mbps	24 Mbps	36 Mbps	48 Mbps	54 Mbps
CH 01	2412 MHz	12.58	12.62	11.90	11.99	11.29	11.26	10.75	10.88
CH 06	2437 MHz	12.86	12.82	12.15	12.27	11.35	11.32	10.79	10.75
CH 11	2462 MHz	13.19	13.11	12.39	12.56	12.00	11.84	11.45	11.46

## 4. Specific Absorption Rate (SAR)

### 4.1 Introduction

SAR is related to the rate at which energy is absorbed per unit mass in an object exposed to a radio field. The SAR distribution in a biological body is complicated and is usually carried out by experimental techniques or numerical modeling. The standard recommends limits for two tiers of groups, occupational/controlled and general population/uncontrolled, based on a person's awareness and ability to exercise control over his or her exposure. In general, occupational/controlled exposure limits are higher than the limits for general population/uncontrolled.

### 4.2 SAR Definition

The SAR definition is the time derivative (rate) of the incremental energy (dW) absorbed by (dissipated in) an incremental mass (dm) contained in a volume element (dv) of a given density.

ρ). The equation description is as below:

$$\mathbf{SAR} = \frac{d}{dt} \left( \frac{dW}{dm} \right) = \frac{d}{dt} \left( \frac{dW}{\rho dv} \right)$$

*SAR is expressed in units of Watts per kilogram (W/kg)*

SAR measurement can be either related to the temperature elevation in tissue by

$$\mathbf{SAR} = C \frac{\delta T}{\delta t}$$

, where C is the specific heat capacity, δ T is the temperature rise and δ t the exposure duration, or related to the electrical field in the tissue by

$$\mathbf{SAR} = \frac{\sigma |E|^2}{\rho}$$

, where σ is the conductivity of the tissue, ρ is the mass density of the tissue and E is the rms electrical field strength.

However for evaluating SAR of low power transmitter, electrical field measurement is typically applied.

## 5. SAR Measurement Setup

Fig. 5.1 DASY5 System

The DASY5 system for performance compliance tests is illustrated above graphically. This system consists of the following items:

- A standard high precision 6-axis robot with controller, a teach pendant and software
- A data acquisition electronic (DAE) attached to the robot arm extension
- A dosimetric probe equipped with an optical surface detector system
- The electro-optical converter (ECO) performs the conversion between optical and electrical signals
- A measurement server performs the time critical tasks such as signal filtering, control of the robot operation and fast movement interrupts.
- A probe alignment unit which improves the accuracy of the probe positioning
- A computer operating Windows XP
- DASY5 software
- Remote control with teach pendant and additional circuitry for robot safety such as warning lamps, etc.
- The SAM twin phantom
- A device holder
- Tissue simulating liquid
- Dipole for evaluating the proper functioning of the system

Some of the components are described in details in the following sub-sections.

**5.1 DASY5 E-Field Probe System**

The SAR measurement is conducted with the dosimetric probe (manufactured by SPEAG).The probe is specially designed and calibrated for use in liquid with high permittivity. The dosimetric probe has special calibration in liquid at different frequency. This probe has a built in optical surface detection system to prevent from collision with phantom.

**5.1.1 E-Field Probe Specification <ET3DV6>**

<b>Construction</b>	Symmetrical design with triangular core Built-in optical fiber for surface detection system Built-in shielding against static charges PEEK enclosure material (resistant to organic solvents)	
<b>Frequency</b>	10 MHz to 3 GHz	
<b>Directivity</b>	± 0.2 dB in brain tissue (rotation around probe axis) ± 0.4 dB in brain tissue (rotation perpendicular to probe axis)	
<b>Dynamic Range</b>	5µW/g to 100mW/g; Linearity: ±0.2dB	
<b>Surface Detection</b>	± 0.2 mm repeatability in air and clear liquids on reflecting surface	
<b>Dimensions</b>	Overall length: 330mm Tip length: 16mm Body diameter: 12mm Tip diameter: 6.8mm Distance from probe tip to dipole centers: 2.7mm	
<b>Application</b>	General dosimetry up to 3GHz Compliance tests for mobile phones and Wireless LAN Fast automatic scanning in arbitrary phantoms	

**Fig. 5.2 Probe Setup on Robot**

5.1.2 E-Field Probe Calibration

Each probe needs to be calibrated according to a dosimetric assessment procedure with accuracy better than ± 10%. The spherical isotropy shall be evaluated and within ± 0.25dB. The sensitivity parameters (NormX, NormY, and NormZ), the diode compression parameter (DCP) and the conversion factor (ConvF) of the probe are tested. The calibration data are as below:

ET3DV6 sn1787 (Cal: Aug. 26, 2008)			
Item	X axis	Y axis	Z axis
Sensitivity (µV)	1.63	1.67	2.18
Diode Compression Point (mV)	90	93	92
Conversion Factor (Head / Body)	Frequency (MHz)	X,Y,Z axis	
	800~1000	6.06 / 5.91	
	1650~1850	5.36 / 4.73	
	1850~2050	5.01 / 4.49	
	2350~2550	4.49 / 3.79	
Boundary Effect (Head / Body)	Frequency (MHz)	Alpha	Depth
	800~1000	0.30 / 0.31	2.80 / 2.98
	1650~1850	0.53 / 0.60	2.11 / 2.20
	1850~2050	0.59 / 0.68	1.96 / 1.95
	2350~2550	0.77 / 0.90	1.57 / 1.51

NOTE: The probe parameters have been calibrated by the SPEAG.

5.2 DATA Acquisition Electronics (DAE)

The data acquisition electronics (DAE) consists of a highly sensitive electrometer-grade preamplifier with auto-zeroing, a channel and gain-switching multiplexer, a fast 16 bit AD-converter and a command decoder and control logic unit. Transmission to the measurement server is accomplished through an optical downlink for data and status information as well as an optical uplink for commands and the clock.

The mechanical probe mounting device includes two different sensor systems for frontal and sideways probe contacts. They are used for mechanical surface detection and probe collision detection.

The input impedance of the DAE is 200M Ohm; the inputs are symmetrical and floating. Common mode rejection is above 80dB.

### **5.3 Robot**

The DASY5 system uses the high precision robots TX90 XL type out of the newer series from Stäubli SA (France). For the 6-axis controller DASY5 system, the CS8C robot controller version from Stäubli is used. The XL robot series have many features that are important for our application:

- High precision (repeatability 0.02 mm)
- High reliability (industrial design)
- Jerk-free straight movements
- Low ELF interference (the closed metallic construction shields against motor control fields)
- 6-axis controller

### **5.4 Measurement Server**

The DASY5 measurement server is based on a PC/104 CPU board with  
400 MHz CPU  
128 MB chipdisk and  
128 MB RAM.

Communication with  
the DAE electronic box  
the 16-bit AD-converter system for optical detection and digital I/O interface.

The measurement server performs all the real-time data evaluation for field measurements and surface detection, controls robot movements and handles safety operations.

### **5.5 SAM Twin Phantom**

The SAM twin phantom is a fiberglass shell phantom with 2mm shell thickness (except the ear region where shell thickness increases to 6mm). It has three measurement areas:

- Left head
- Right head
- Flat phantom

The bottom plate contains three pair of bolts for locking the device holder. The device holder positions are adjusted to the standard measurement positions in the three sections. A white cover is provided to tap the phantom during off-periods to prevent water evaporation and changes in the liquid parameters. On the phantom top, three reference markers are provided to identify the phantom position with respect to the robot.

The phantom can be used with the following tissue simulating liquids:

\*Water-sugar based liquid

\*Glycol based liquids

**Fig. 5.3 Top View of Twin Phantom**

**Fig. 5.4 Bottom View of Twin Phantom**

### **5.6 Device Holder for SAM Twin Phantom**

The SAR in the Phantom is approximately inversely proportional to the square of the distance between the source and the liquid surface. For a source in 5 mm distance, a positioning uncertainty of  $\pm 0.5\text{mm}$  would produce a SAR uncertainty of  $\pm 20\%$ . An accurate device position is therefore crucial for accurate and repeatable measurement. The position in which the devices must be measured, are defined by the standards.

The DASY5 device holder is designed to cope with different positions given in the standard. It has two scales for the device rotation (with respect to the body axis) and the device inclination (with respect to the line between the ear reference points). The rotation center for both scales is the ear reference point (EPR).

Thus the device needs no repositioning when changing the angles.

The DASY5 device holder has been made out of low-loss POM material having the following dielectric parameters: relative permittivity  $\epsilon_r = 3$  and loss tangent  $\delta = 0.02$ . The amount of dielectric material has been reduced in the closest vicinity of the device, since measurements have suggested that the influence of the clamp on the test results could thus be lowered.

**Fig. 5.1 Device Holder**

5.7 Data Storage and Evaluation

5.7.1 Data Storage

The DASY5 software stores the assessed data from the data acquisition electronics as raw data (in microvolt readings from the probe sensors), together with all the necessary software parameters for the data evaluation (probe calibration data, liquid parameters and device frequency and modulation data) in measurement files with the extension. The post-processing software evaluates the desired unit and format for output each time the data is visualized or exported. This allows verification of the complete software setup even after the measurement and allows correction of erroneous parameter settings. For example, if a measurement has been performed with an incorrect crest factor parameter in the device setup, the parameter can be corrected afterwards and the data can be reevaluated.

The measured data can be visualized or exported in different units or formats, depending on the selected probe type (e.g., [V/m], [A/m], [mW/g]). Some of these units are not available in certain situations or give meaningless results, e.g., a SAR-output in a non-lose media, will always be zero. Raw data can also be exported to perform the evaluation with other software packages.

5.7.2 Data Evaluation

The DASY5 post-processing software (SEMCAD) automatically executes the following procedures to calculate the field units from the microvolt readings at the probe connector. The parameters used in the evaluation are stored in the configuration modules of the software :

- Probe parameters :**
  - Sensitivity Norm<sub>j</sub>, a<sub>ρ</sub>, a<sub>i1</sub>, a<sub>2</sub>
  - Conversion factor ConvF<sub>j</sub>
  - Diode compression point dcp<sub>j</sub>
- Device parameters :**
  - Frequency f
  - Crest factor cf
- Media parameters :**
  - Conductivity σ
  - Density ρ

These parameters must be set correctly in the software. They can be found in the component documents or they can be imported into the software from the configuration files issued for the DASY5 components. In the direct measuring mode of the multi-meter option, the parameters of the actual system setup are used. In the scan visualization and export modes, the parameters stored in the corresponding document files are used.

The first step of the evaluation is a linearization of the filtered input signal to account for the compression characteristics of the detector diode. The compensation depends on the input signal, the diode type and the DC-transmission factor from the diode to the evaluation electronics. If the exciting field is pulsed, the crest factor of the signal must be known to correctly compensate for peak power.

The formula for each channel can be given as :

$$V_i = U_i + U_i^2 \cdot \frac{cf}{dcp_i}$$

with  **$V_i$**  = compensated signal of channel  $i$  ( $i = x, y, z$ )  
 **$U_i$**  = input signal of channel  $i$  ( $i = x, y, z$ )  
 **$cf$**  = crest factor of exciting field (DASY parameter)  
 **$dcp_i$**  = diode compression point (DASY parameter)

From the compensated input signals, the primary field data for each channel can be evaluated :

**E-field probes :**  $E_i = \sqrt{\frac{V_i}{Norm_i ConvF}}$

**H-field probes :**  $H_i = \sqrt{V_i \frac{a_{i0} + a_{i1}f + a_{i2}f^2}{f}}$

with  **$V_i$**  = compensated signal of channel  $i$  ( $i = x, y, z$ )  
 **$Norm_i$**  = sensor sensitivity of channel  $i$  ( $i = x, y, z$ )  
 $\mu V/(V/m)^2$  for E-field Probes  
 **$ConvF$**  = sensitivity enhancement in solution  
 **$a_{ij}$**  = sensor sensitivity factors for H-field probes  
 **$f$**  = carrier frequency [GHz]  
 **$E_i$**  = electric field strength of channel  $i$  in V/m  
 **$H_i$**  = magnetic field strength of channel  $i$  in A/m

The RSS value of the field components gives the total field strength (Hermitian magnitude) :

$$E_{tot} = \sqrt{E_x^2 + E_y^2 + E_z^2}$$

The primary field data are used to calculate the derived field units.

$$SAR = E_{tot}^2 \cdot \frac{\sigma}{\rho \cdot 1000}$$

with  **$SAR$**  = local specific absorption rate in mW/g  
 **$E_{tot}$**  = total field strength in V/m  
 $\sigma$  = conductivity in [mho/m] or [Siemens/m]  
 $\rho$  = equivalent tissue density in  $g/cm^3$

\* Note that the density is set to 1, to account for actual head tissue density rather than the density of the tissue simulating liquid.

The power flow density is calculated assuming the excitation field to be a free space field.

$$P_{pwe} = \frac{E_{tot}^2}{3770} \quad \text{or} \quad P_{pwe} = H_{tot}^2 \cdot 37.7$$

with  **$P_{pwe}$**  = equivalent power density of a plane wave in  $mW/cm^2$   
 **$E_{tot}$**  = total electric field strength in V/m  
 **$H_{tot}$**  = total magnetic field strength in A/m

**Table 5.1 Test Equipment List**

## 6. Tissue Simulating Liquids

For the measurement of the field distribution inside the SAM phantom with DASY5, the phantom must be filled with around 25 liters of homogeneous tissue simulating liquid. The liquid height from the ear reference point (ERP) of the phantom to the liquid top surface is (head SAR) or from the flat phantom to the liquid top surface (body SAR) is 15.2cm.

The following ingredients for tissue simulating liquid are used:

- **Water:** deionized water (pure H<sub>2</sub>O), resistivity 16MΩ- as basis for the liquid
- **Sugar:** refined sugar in crystals, as available in food shops – to reduce relative permittivity
- **Salt:** pure NaCl – to increase conductivity
- **Cellulose:** Hydroxyethyl-cellulose, medium viscosity (75-125 mPa.s, 2% in water, 20°C), CAS#54290-to increase viscosity and to keep sugar in solution.
- **Preservative:** Preventol D-7 Bayer AG, D-51368 Leverkusen, CAS#55965-84-9- to prevent the spread of bacteria and molds.
- **DGMBE:** Deithlenglycol-monobuthyl ether (DGMBE), Fluka Chemie GmbH, CAS#112-34-5 – to reduce relative permittivity.

Table 6.1 gives the recipes for tissue simulating liquid.

Frequency (MHz)	Water (%)	Sugar (%)	Cellulose (%)	Salt (%)	Preventol (%)	DGBE (%)	Conductivity (σ)	Permittivity (ε <sub>r</sub> )
<b>For Head</b>								
835	40.3	57.9	0.2	1.4	0.2	0	0.90	41.5
900	40.3	57.9	0.2	1.4	0.2	0	0.97	41.5
1800, 1900, 2000	55.2	0	0	0.3	0	44.5	1.40	40.0

### 7. Uncertainty Assessment

The component of uncertainty may generally be categorized according to the methods used to evaluate them. The evaluation of uncertainty by the statistical analysis of a series of observations is termed a Type A evaluation of uncertainty. The evaluation of uncertainty by means other than the statistical analysis of a series of observation is termed a Type B evaluation of uncertainty. Each component of uncertainty, however evaluated, is represented by an estimated standard deviation, termed standard uncertainty, which is determined by the positive square root of the estimated variance.

A Type A evaluation of standard uncertainty may be based on any valid statistical method for treating data. This includes calculating the standard deviation of the mean of a series of independent observations; using the method of least squares to fit a curve to the data in order to estimate the parameter of the curve and their standard deviations; or carrying out an analysis of variance in order to identify and quantify random effects in certain kinds of measurement.

A type B evaluation of standard uncertainty is typically based on scientific judgment using all of the relevant information available. These may include previous measurement data, experience and knowledge of the behavior and properties of relevant materials and instruments, manufacture’s specification, data provided in calibration reports and uncertainties assigned to reference data taken from handbooks. Broadly speaking, the uncertainty is either obtained from an outdoor source or obtained from an assumed distribution, such as the normal distribution, rectangular or triangular distributions indicated in Table 7.1

Uncertainty Distributions	Normal	Rectangular	Triangular	U-shape
<b>Multiplying factor<sup>(a)</sup></b>	1/k <sup>(b)</sup>	1/√3	1/√6	1/√2

(a) standard uncertainty is determined as the product of the multiplying factor and the estimated range of variations in the measured quantity

(b)  $\kappa$  is the coverage factor

**Table 7.1 Standard Uncertainty for Assumed Distribution**

The combined standard uncertainty of the measurement result represents the estimated standard deviation of the result. It is obtained by combining the individual standard uncertainties of both Type A and Type B evaluation using the usual “root-sum-squares” (RSS) methods of combining standard deviations by taking the positive square root of the estimated variances.

Expanded uncertainty is a measure of uncertainty that defines an interval about the measurement result within which the measured value is confidently believed to lie. It is obtained by multiplying the combined standard uncertainty by a coverage factor. Typically, the coverage factor ranges from 2 to 3. Using a coverage factor allows the true value of a measured quantity to be specified with a defined probability within the specified uncertainty range. For purpose of this document, a coverage factor two is used, which corresponds to confidence interval of about 95 %. The DASY5 uncertainty Budget is showed in Table 7.2.

Error Description	Uncertainty Value ± %	Probability Distribution	Divisor	Ci (1g)	Standard Unc. (1g)	vi or Veff
<b>Measurement Equipment</b>						
Probe Calibration	±5.9 %	Normal	1	1	±5.9 %	∞
Axial Isotropy	±4.7 %	Rectangular	√3	0.7	±1.9 %	∞
Hemispherical Isotropy	±9.6 %	Rectangular	√3	0.7	±3.9 %	∞

## 8. SAR Measurement Evaluation

Each DASY5 system is equipped with one or more system validation kits. These units, together with the predefined measurement procedures within the DASY5 software, enable the user to conduct the system performance check and system validation. System validation kit includes a dipole, tripod holder to fix it underneath the flat phantom and a corresponding distance holder.

### 8.1 Purpose of System Performance check

The system performance check verifies that the system operates within its specifications. System and operator errors can be detected and corrected. It is recommended that the system performance check be performed prior to any usage of the system in order to guarantee reproducible results. The system performance check uses normal SAR measurements in a simplified setup with a well characterized source. This setup was selected to give a high sensitivity to all parameters that might fail or vary over time. The system check does not intend to replace the calibration of the components, but indicates situations where the system uncertainty is exceeded due to drift or failure.

### 8.2 System Setup

In the simplified setup for system evaluation, the DUT is replaced by a calibrated dipole and the power source is replaced by a continuous wave which comes from a signal generator at frequency 2450 MHz. The calibrated dipole must be placed beneath the flat phantom section of the SAM twin phantom with the correct distance holder. The distance holder should touch the phantom surface with a light pressure at the reference marking and be oriented parallel to the long side of the phantom. The equipment setup is shown below:

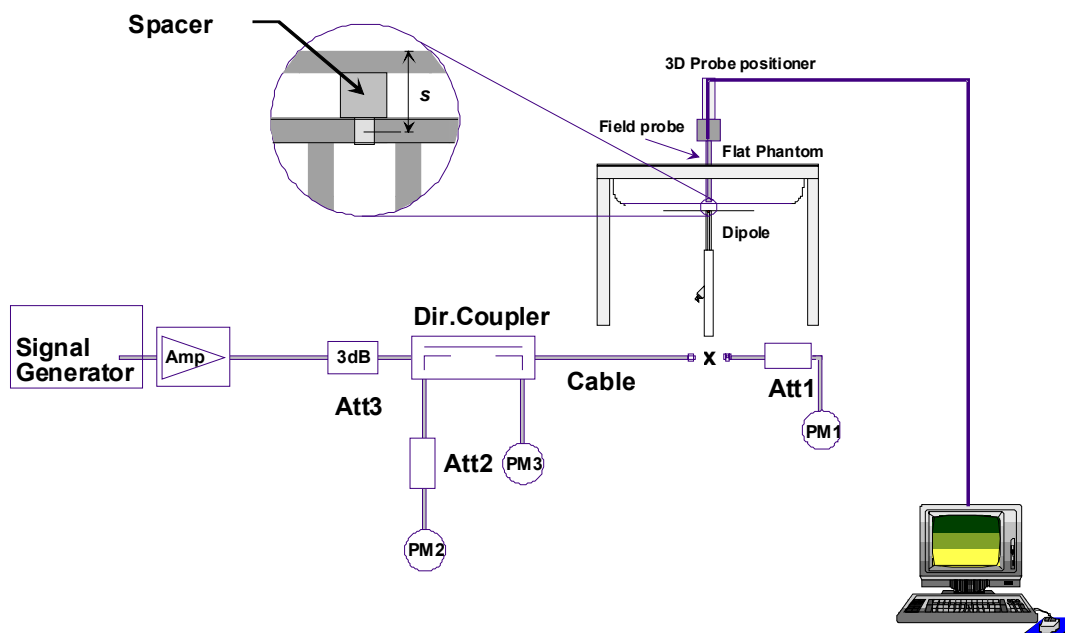

Fig. 8.1 System Setup for System Evaluation

1. Signal Generator
2. Amplifier
3. Directional Coupler
4. Power Meter
5. 2450 MHz Dipole

The output power on dipole port must be calibrated to 20dBm (100mW) before dipole is connected.

**Fig 8.2 Dipole Setup**

**8.3 Validation Results**

Comparing to the original SAR value provided by SPEAG, the validation data should be within its specification of 10 %. Table 8.1 shows the target SAR and measured SAR after normalized to 1W input power. The table below indicates the system performance check can meet the variation criterion.

Frequency (MHz)	Position	SAR	Target (W/kg)	Measurement Data (W/kg)	Variation	Measurement Date
2450	Head	SAR (1g)	52.7	53.1	0.8 %	Feb. 23, 2009
		SAR (10g)	24.5	24.7	0.8 %	
	Body	SAR (1g)	52.5	48.3	-8.0 %	Feb. 23, 2009
		SAR (10g)	24.4	22.6	-7.4 %	

**Table 8.1 Target and Measurement Data Comparison**

## **9. Description for DUT Testing Position**

This DUT was tested in six different positions. They are right cheek, right tilted, left cheek, left tilted, face with 1.5 cm Gap and bottom with 1.5 cm Gap as illustrated below: (Please refer to Appendix E for the test setup photos.)

- 1) “Cheek Position”
  - i) To position the device with the vertical center line of the body of the device and the horizontal line crossing the center piece in a plane parallel to the sagittal plane of the phantom. While maintaining the device in this plane, align the vertical center line with the reference plane containing the three ear and mouth reference point (M, RE and LE) and align the center of the ear piece with the line RE-LE.
  - ii) To move the device towards the phantom with the ear piece aligned with the line LE-RE until the phone touched the ear. While maintaining the device in the reference plane and maintaining the phone contact with the ear, move the bottom of the phone until any point on the front side is in contact with the cheek of the phantom or until contact with the ear is lost (see Fig. 9.1).
  
- 2) “Tilted Position”
  - i) To position the device in the “cheek” position described above
  - ii) While maintaining the device the reference plane described above and pivoting against the ear, moves it outward away from the mouth by an angle of 15 degrees or until contact with the ear is lost (sees Fig. 9.2).
  
- 3) “Body Worn”
  - i) To position the device parallel to the phantom surface with either keypad up or down.
  - ii) To adjust the device parallel to the flat phantom.
  - iii) To adjust the distance between the device surface and the flat phantom to 1.5 cm.

Fig. 9.1 Phone Position 1, "Cheek" or "Touch" Position. The reference points for the right ear (RE), left ear (LE) and mouth (M), which define the plane for phone positioning, are indicated.

Fig. 9.2 Phone Position 2, "Tilted Position". The reference point for the right ear (RE), left ear (LE) and mouth (M), which define the plane for phone positioning, are indicated.

## **10. Measurement Procedures**

The measurement procedures are as follows:

- Using engineering software to transmit RF power continuously (continuous Tx)
- Measuring output power through RF cable and power meter
- Placing the DUT in the positions described in the last section
- Setting scan area, grid size and other setting on the DASY5 software
- Taking data

According to the OET Bulletin 65 Supplement C standard, the recommended procedure for assessing the peak spatial-average SAR value consists of the following steps:

- Power reference measurement
- Area scan
- Zoom scan
- Power reference measurement

### **10.1 Spatial Peak SAR Evaluation**

The procedure for spatial peak SAR evaluation has been implemented according to the OET Bulletin 65 Supplement C standard. It can be conducted for 1g and 10g, as well as for user-specific masses. The DASY5 software includes all numerical procedures necessary to evaluate the spatial peak SAR value.

The base for the evaluation is a "cube" measurement. The measured volume must include the 1g and 10g cubes with the highest averaged SAR values. For that purpose, the center of the measured volume is aligned to the interpolated peak SAR value of a previously performed area scan.

The entire evaluation of the spatial peak values is performed within the post-processing engine (SEMCAD). The system always gives the maximum values for the 1g and 10g cubes. The algorithm to find the cube with highest averaged SAR is divided into the following stages:

- extraction of the measured data (grid and values) from the Zoom Scan
- calculation of the SAR value at every measurement point based on all stored data (A/D values and measurement parameters)
- generation of a high-resolution mesh within the measured volume
- interpolation of all measured values from the measurement grid to the high-resolution grid
- extrapolation of the entire 3-D field distribution to the phantom surface over the distance from sensor to surface
- calculation of the averaged SAR within masses of 1g and 10g

## **10.2 Scan Procedures**

First Area Scan is used to locate the approximate location(s) of the local peak SAR value(s). The measurement grid within an Area Scan is defined by the grid extent, grid step size and grid offset. Next, in order to determine the EM field distribution in a three-dimensional spatial extension, Zoom Scan is required. The Zoom Scan measures 5x5x7 points with step size 8, 8 and 5 mm. The Zoom Scan is performed around the highest E-field value to determine the averaged SAR-distribution over 1 g.

## **10.3 SAR Averaged Methods**

In DASYS, the interpolation and extrapolation are both based on the modified Quadratic Shepard's method. The interpolation scheme combines a least-square fitted function method and a weighted average method which are the two basic types of computational interpolation and approximation.

Extrapolation routines are used to obtain SAR values between the lowest measurement points and the inner phantom surface. The extrapolation distance is determined by the surface detection distance and the probe sensor offset. The uncertainty increases with the extrapolation distance. To keep the uncertainty within 1% for the 1 g and 10 g cubes, the extrapolation distance should not be larger than 5 mm.

## 11. SAR Test Results

### 11.1 Conducted Power

Channel	Band	802.11b (dBm)	802.11g (dBm)
	Data Rate	1 Mbps	6 Mbps
1		16.57	12.58
6		16.17	12.86
11		16.24	13.19

### 11.2 Test Records for Head SAR Test

Position	Band	Chan.	Freq. (MHz)	Modulation Type	Battery	Measured 1g SAR (W/kg)	Limit (W/kg)	Result
<b>Right Cheek</b>	<b>802.11b</b>	<b>1</b>	<b>2412</b>	<b>DSSS</b>	<b>1</b>	<b>0.256</b>	<b>1.6</b>	<b>Pass</b>
Right Cheek	802.11b	1	2412	DSSS	2	0.226	1.6	Pass
Right Cheek	802.11b	1	2412	DSSS	3	0.230	1.6	Pass
From the above pre-scan, the worse SAR is Battery 1, which is used for all other test modes.								
Right Tilted	802.11b	1	2412	DSSS	1	0.087	1.6	Pass
Left Cheek	802.11b	1	2412	DSSS	1	0.253	1.6	Pass
Left Tilted	802.11b	1	2412	DSSS	1	0.094	1.6	Pass

### 11.3 Test Records for Body SAR Test

Position	Band	Chan.	Freq. (MHz)	Modulation Type	Battery	Measured 1g SAR (W/kg)	Limit (W/kg)	Result
Bottom with 1.5cm Gap	802.11b	1	2412	DSSS	1	0.132	1.6	Pass
Bottom with 1.5cm Gap	802.11b	1	2412	DSSS	2	0.161	1.6	Pass
<b>Bottom with 1.5cm Gap</b>	<b>802.11b</b>	<b>1</b>	<b>2412</b>	<b>DSSS</b>	<b>3</b>	<b>0.192</b>	<b>1.6</b>	<b>Pass</b>
From the above pre-scan, the worse SAR is Battery 3, which is used for all other test modes.								
Face with 1.5cm Gap	802.11b	1	2412	DSSS	3	0.085	1.6	Pass

Test Engineer : Eric Huang, Robert Liu, and A-Rod Chen

**DUT: 920507-01**

Communication System: 802.11b ; Frequency: 2412 MHz;Duty Cycle: 1:1  
Medium: HSL\_2450 Medium parameters used: f = 2412 MHz;  $\sigma = 1.79$  mho/m;  $\epsilon_r = 38.8$ ;  $\rho = 1000$  kg/m<sup>3</sup>  
Ambient Temperature : 23.0 ; Liquid Temperature : 21.3

DASY5 Configuration:

- Probe: ET3DV6 - SN1788; ConvF(4.68, 4.68, 4.68); Calibrated: 2008/9/23
- Sensor-Surface: 4mm (Mechanical Surface Detection)
- Electronics: DAE3 Sn577; Calibrated: 2008/11/12
- Phantom: SAM - Front; Type: SAM; Serial: TP-1446
- Measurement SW: DASY5, V5.0 Build 120; SEMCAD X Version 13.4 Build 45

**Ch1/Area Scan (61x91x1):** Measurement grid: dx=15mm, dy=15mm  
Maximum value of SAR (interpolated) = 0.108 mW/g

**Ch1/Zoom Scan (5x5x7)/Cube 0:** Measurement grid: dx=8mm, dy=8mm, dz=5mm  
Reference Value = 6.38 V/m; Power Drift = -0.113 dB  
Peak SAR (extrapolated) = 0.186 W/kg  
**SAR(1 g) = 0.094 mW/g; SAR(10 g) = 0.050 mW/g**  
Maximum value of SAR (measured) = 0.099 mW/g

**Ch1/Zoom Scan (5x5x7)/Cube 1:** Measurement grid: dx=8mm, dy=8mm, dz=5mm  
Reference Value = 6.38 V/m; Power Drift = -0.113 dB  
Peak SAR (extrapolated) = 0.126 W/kg  
**SAR(1 g) = 0.066 mW/g; SAR(10 g) = 0.040 mW/g**  
Maximum value of SAR (measured) = 0.071 mW/g

0 dB = 0.071mW/g

Test Laboratory: Sporton International Inc. SAR/HAC Testing Lab

Date: 2009/2/23

**Body\_802.11b Ch1\_Face with 1.5cm Gap\_Battery3**

**DUT: 920507-01**

Communication System: 802.11b ; Frequency: 2412 MHz;Duty Cycle: 1:1

Medium: MSL\_2450 Medium parameters used:  $f = 2412$  MHz;  $\sigma = 1.88$  mho/m;  $\epsilon_r = 53.7$ ;  $\rho = 1000$  kg/m<sup>3</sup>

Ambient Temperature : 23.0 ; Liquid Temperature : 21.5

DASY5 Configuration:

- Probe: ET3DV6 - SN1788; ConvF(3.98, 3.98, 3.98); Calibrated: 2008/9/23
- Sensor-Surface: 4mm (Mechanical Surface Detection)
- Electronics: DAE3 Sn577; Calibrated: 2008/11/12
- Phantom: SAM-Back; Type: QD 000 P40 C; Serial: TP-1383
- Measurement SW: DASY5, V5.0 Build 120; SEMCAD X Version 13.4 Build 45

**Ch1/Area Scan (61x91x1):** Measurement grid: dx=15mm, dy=15mm

Maximum value of SAR (interpolated) = 0.089 mW/g

**Ch1/Zoom Scan (5x5x7)/Cube 0:** Measurement grid: dx=8mm, dy=8mm, dz=5mm

Reference Value = 4.4 V/m; Power Drift = -0.102 dB

Peak SAR (extrapolated) = 0.156 W/kg

**SAR(1 g) = 0.085 mW/g; SAR(10 g) = 0.050 mW/g**

Maximum value of SAR (measured) = 0.092 mW/g

**Ch1/Zoom Scan (5x5x7)/Cube 1:** Measurement grid: dx=8mm, dy=8mm, dz=5mm

Reference Value = 4.4 V/m; Power Drift = -0.102 dB

Peak SAR (extrapolated) = 0.170 W/kg

**SAR(1 g) = 0.081 mW/g; SAR(10 g) = 0.045 mW/g**

Maximum value of SAR (measured) = 0.085 mW/g

0 dB = 0.085mW/g

Test Laboratory: Sporton International Inc. SAR/HAC Testing Lab

Date: 2009/2/23

**Body\_802.11b Ch1\_Bottom with 1.5cm Gap\_Battery3**

**DUT: 920507-01**

Communication System: 802.11b ; Frequency: 2412 MHz;Duty Cycle: 1:1

Medium: MSL\_2450 Medium parameters used:  $f = 2412$  MHz;  $\sigma = 1.88$  mho/m;  $\epsilon_r = 53.7$ ;  $\rho = 1000$  kg/m<sup>3</sup>

Ambient Temperature : 22.9 ; Liquid Temperature : 21.5

DASY5 Configuration:

- Probe: ET3DV6 - SN1788; ConvF(3.98, 3.98, 3.98); Calibrated: 2008/9/23
- Sensor-Surface: 4mm (Mechanical Surface Detection)
- Electronics: DAE3 Sn577; Calibrated: 2008/11/12
- Phantom: SAM-Back; Type: QD 000 P40 C; Serial: TP-1383
