2. Measurement Parameters

2.1 Passive Parameters

2.1.1 VSWR

VSWR indicates the matching characteristics of the antenna. VSWR can be measured by a network analyzer.

2.1.2 Antenna Gain and Pattern

Antenna gain and far-field pattern can be determined by two measurement skills, depending on the own equipments. One is the far-field measurement; the other is the 3-D measurement system. Sometimes, the gain value is also needed to be measured under specified user conditions.

2.2 Active Parameters

2.2.1 Radiation Power

Antenna radiation power means the real radiated ability of an active system. Two most popular index values to specify the ability of radiation power is EIRP and TRP. EIRP means the peak radiation power, and TRP is the total radiation power. In some user conditions, the TRP value is also specified.

2.2.2 Receiving Sensitivity

Antenna radiation power means the real receiving ability of an active system. Two most popular index values to specify the ability of receiving ability is EIS and TIS. EIS means the peak receiving sensitivity, and TIS is the total receiving sensitivity. In some user conditions, the TIS value is also specified.

2.2.3 SAR (Specified Absorption Rate)

In order to protect the health of human, WHO has specified the SAR value (Specified Absorption Rate of human) to ensure the RF device has less damage to human health. The SAR value limitation is 1.6mW/g.
