To Whom It May Concern:

The enclosed class II permissive change is for a change to the setup of the previously added three antennas. Previously we set the software for a lower attenuation and used higher external attenuators to achieve a compliant system. In this version we are now setting the software for a higher attenuation level and no longer need the external attenuation. This preserves our receiver gain and allows for a lower receive noise figure. Our systems are always professionally installed and the end user never has access to any attenuation settings.

Regards,

Chris Leigh
