1.2 Product Description

The Tottori Sanyo Electric Co., Ltd. Model DMC 201 is a CDMA Digital/Analog cellular phone.

Use of Product	Portable Cellular Phone
Whether quantity (> 1) production is planned	☒ Yes, ☐ No
Cellular Phone standards	☒ AMPS ☐ NAMPS ☐ CDPD ☐ TDMA ☒ CDMA
Type(s) of Emission	40K078W, 40K0F1D, 1M25F9W (CDMA)
Allowed Deviation	12± 10%
Range of RF Output	479 (Mps) 200 mW (CDMA)
The dc voltage applied to and current into the several elements of the final RF amplifying device	Voltage: 3.2 - 4.2V Current: 900 mA
Frequency Range	824.4 - 848.97 (Amps) 824.7 - 848.3 (CDMA)
Antenna(e) & Gain	0 dBi
Detachable antenna ?	☐ Yes ☒ No
Receiver L.O. frequency	
External input	☒ Audio ☐ Digital Data

1.3 Related Submittal(s) Grants

6. Specifications

SPECIFICATIONS

1, GENERAL

<i>Item</i>	<i>Spec</i>
Operating temperature	-30~60℃
Storage temperature	-40~80℃
Supply voltage	3.2~4.2V
Current consumption	
①Power switched off	①Less than 1mA
②AMPS at stand by	②About 75mA
③CDMA at stand by	③About 110mA (max)
④AMPS transmitting at maximum power of 0.6W	④About 900mA
⑤CDMA transmitting at maximum power of 0.2W	⑤About 720mA (max)
⑥Weight	⑥About 122 (g)
⑦Dimensions	⑦W*H*D= 44.8*129.0*24.6 (mm)

2, ELECTRICAL

[1] AMPS Transceiver features

<i>Item</i>	<i>Spec</i>
Transceiver frequency range	824.04~848.97MHz
Receiving frequency range	869.04~893.97MHz
Duplex spacing	45MHz
Channel spacing	30kHz
Rx first IF frequency	85.38MHz
Tx IF frequency	130.38MHz
Number of channels	832 duplex operation

[2] CDMA Transceiver features

<i>Item</i>	<i>Spec</i>
Transceiver frequency range	824.70~848.31MHz
Receiving frequency range	869.70~893.31MHz
Duplex spacing	45MHz
Rx first IF frequency	85.38MHz
Tx IF frequency	130.38MHz

[3] AMPS transmitter

<i>Item</i>	<i>Spec</i>
RF output power	0.6W~6.3mW(6levels in 4dB steps) tolerance +2, -4dB
Spurious emissions at antenna connector inside cellular band	①Less than -43dBm fc=±90kHz, B=30kHz ②Less than -80dBm f=869~894MHz
Tx on/off delay	Less than 2ms
Modulation distortion	Less than -26dB at 1kHz audio, ±8kHz deviation
Wideband data deviation	±8kHz ±0.8kHz
ST frequency deviation	±8kHz ±0.8kHz
SAT frequency deviation	±2kHz ±0.2kHz
DTMF deviation	4.5peak radians ±10%

[4] CDMA transmitter

<i>Item</i>	<i>Spec</i>
Maximum RF output power	0.2W
Minimum RF output power	Less than -50dBm/1.23MHz
Frequency accuracy	±300Hz

[5] AMPS receiver

<i>Item</i>	<i>Spec</i>
Sensitivity	Less than -116dBm (12dB SINAD)
Distortion	Less than -26dB
S/N	More than 32dB
Selectivity	More than 65dB fr±60kHz
AM attenuation	More than 26dB
Intermodulation performance	More than 60dB
Spurious supression	More than 60dB
Spurious emissions	Less than -80dB at 869~894MHz
RSSI dynamics	More than 60dB

MODEL No. DMC201

[6] CDMA receiver

<i>Item</i>	<i>Spec</i>
Receiver sensitivity	Less than -104dBm/1.23MHz
Single tone desensitization	Less than -101dBm/1.23MHz
Intermodulation spurious response attenuation	More than 58dB
Conducted spurious emissions	Less than -81dBm at 869~894MHz Less than -61dBm at 824~849MHz Less than -47dBm all other Frequency
Radiated spurious emissions	Less than -45dBm (25~70MHz) Less than -41dBm (70~130MHz) Less than -41dBm (130~174MHz) Less than -32dBm (174~260MHz) Less than -32dBm (260~470MHz) Less than -21dBm (470~1000MHz)

[7] Battery pack

<i>Item</i>	<i>Spec</i>
Capacity	1400mAh
Battery Packing	3.6V, 1400mAh, Li-ion Rechargeable

Date of Test: May 27 & 28, 1999 & July 7, 1999

2.0 RF Power Output, FCC §2.985(a), §22.913

2.1 Test Procedure

The transmitter output was connected to a calibrated coaxial attenuator, the other end of which was connected to a spectrum analyzer. Transmitter output was read off the spectrum analyzer in dBm. The power output at the transmitter antenna port was determined by adding the value of the attenuator to the spectrum analyzer reading. An HP power meter was also used to measure the RF power.

Tests were performed at three frequencies (low, middle, and high channels) and on all power levels which can be setup on the transmitters.

3.0 Effective Radiated Power, FCC § 22.913

The Effective Radiated Power (ERP) of mobile transmitters and auxiliary test transmitters must not exceed 7 Watts.

3.1 Test Procedure

The EUT was positioned on a non-conductive turntable, 0.8m above the ground plane on an open test site.

The radiated emission at the fundamental frequency was measured at 3m distance with a test antenna and spectrum analyzer. During the measurement, the resolution and video bandwidths of the spectrum analyzer were set to 100 kHz. Worst case emission was recorded with the rotation of the turntable and the raising and lowering of the test antenna. The spectrum analyzer reading (R_{EUT}) was recorded.

The EUT was replaced by a half-wave tuned dipole connected to a signal generator. The frequency of the signal generator was adjusted to the transmitter frequency.

The test antenna was raised and lowered to ensure that a maximum signal was received. The signal generator output level (P_G) was adjusted to obtain the spectrum analyzer reading (R_G) as close as possible to the previously recorded spectrum analyzer reading (R_{EUT}).

The test was performed at three frequencies (low, middle, and high channels).

In addition, the Equivalent Isotropic Radiated Power (EIRP) in dBpW was calculated as follows:

$$EIRP_{(dBpW)} = ERP_{(dBm)} + 90 + 10 \log 1.64$$

3.2 Test Equipment

Rhode & Schwartz SMH Signal Generator
Hewlett Packard HP8566B Spectrum Analyzer
Attenuator 20 dB

4.0 Modulation Deviation Limiting, FCC § 2.987, § 22.915(c)s

4.1 Test Procedure

The RF output of the transceiver was connected to the input of an FM deviation meter through sufficient attenuation so as not to overload the meter or distort the readings. An audio signal generator with a variable attenuator on the output was coupled into the external microphone jack of the transceiver, or alternatively, the microphone element was removed and the generator output was connected to the microphone wires by clip leads.

At three different modulating frequencies, the output level of the audio generator was varied and the FM deviation level was recorded (Table 4.1a).

Date of Test: May 27 & 28, 1999 & July 7, 1999

5.0 Audio Filter Characteristics, FCC § 22.915(d)

For mobile stations, these signals must be attenuated, relative to the level at 1 kHz, as follows:

- (i) In the frequency ranges of 3.0 to 5.9 kHz and 6.1 to 15.0 kHz, signals must be attenuated by at least $40 \log (f/3)$ dB, where f is the frequency of the signal in kHz.
- (ii) In the frequency range of 5.9 to 6.1 kHz, signals must be attenuated at least 35 dB.
- (iii) In the frequency range above 15 kHz, signals must be attenuated at least 28 dB.

5.1 Test Procedure

The RF output of the transceiver was connected to the input of an FM deviation meter through sufficient attenuation so as not to overload the meter or distort the readings. An audio signal generator with a variable attenuator on the output was coupled into the external microphone jack of the transceiver, or alternatively, the microphone element was removed and the generator output was connected to the microphone wires by clip leads.

The audio signal at the transceiver audio input was adjusted to obtain 8-9 kHz deviation at the more sensitive modulation frequency (approximately 2.7 kHz). The audio frequency was varied from 300 Hz to 30 kHz and the deviation was measured while maintaining a constant input level. Using the level measured at 1 kHz as a reference (0 dB), the audio filter response was calculated (See Table 5-1).

The block diagram of the test setup is shown below.

Tottori Sanyo Electric Co., Ltd., Cellular Phone
FCC ID: NRNDMC200

Date of Test: May 27 & 28, 1999 & July 7, 1999

On that block diagram, the HP 3885A spectrum analyzer having the tracing generator, and the Marconi 2955A Radio Communication Test Set having an output of a demodulator, are used. After the calibration was made (the -20 dBm reading of the spectrum analyzer corresponds to the 9 kHz deviation) the spectrum analyzer was set to scan the frequency from 300 Hz to 30 kHz, with the same audio input level as described above, and with compressor OFF and expander OFF.

The audio filter response was plotted directly from the spectrum analyzer (Refer to Plots # 5.1.a, 5.1.b, & 5.1.c).
