

## 2400 MHz OEM Frequency Hopping / DTS Module Model No.: MHX2421

FCC ID: NS907P23

Applicant:

Microhard Systems Inc. #17, 2135 - 32nd Avenue N.E. Calgary, Alberta Canada T2E 6Z3

In Accordance With

### Federal Communications Commission (FCC) Part 15, Subpart C, Section 15.247 Frequency Hopping Spread Spectrum (FHSS) / Digital Modulation Systems (DTS) Operating in 2400–2483.5 MHz Band

### UltraTech's File No.: MCRS-013F15C247

| This Test report is Issued under the Authority of<br>Tri M. Luu, Professional Engineer,<br>Vice President of Engineering<br>UltraTech Group of Labs<br>Date: August 22, 2007 | T.M. AND   |
|--|--|
| Report Prepared by: Dan Huynh  | Tested by: Mr. Hung Trinh, EMI/RFI Technician  |
| Issued Date: August 22, 2007   | Test Dates: July 26-31, August 1, 2 , 10 & 22, 2007  |
| The results in this Test Report apply only to the sample(s) tester<br>This report must not be used by the client to claim product endor                                      | d, and the sample tested is randomly selected.<br>orsement by NVI AP or any agency of the US Government. |

## 3.2. EQUIPMENT UNDER TEST (EUT) INFORMATION

The following information (with the exception of the Date of Receipt) has been supplied by the applicant.

| Brand Name:                    | Microhard Systems Inc.                                    |
|--------------------------------|---|
| Product Name:                  | 2400 MHz OEM Frequency Hopping / DTS Module               |
| Model Name or Number:          | MHX2421   |
| Serial Number:                 | Test Sample   |
| Type of Equipment:             | Spread Spectrum Transmitter / Digital Transmission System |
| Input Power Supply Type:       | External Regulated DC Sources                             |
| Primary User Functions of EUT: | Spread Spectrum OEM Transceiver.                          |

## 3.3. EUT'S TECHNICAL SPECIFICATIONS

|                                 | TRANSMITTER  |  |
|---------------------------------|--|--|
| Equipment Type:                 | <ul><li>Mobile</li><li>Base Station (fixed use)</li></ul>  |  |
| Intended Operating Environment: | <ul><li>Commercial, industrial or business environment</li><li>Residential environment</li></ul> |  |
| Power Supply Requirement:       | 4 to 5.5VDC  |  |
| RF Output Power Rating:         | 0.001 to 1 W   |  |
| Operating Frequency Range:      | 2401.6 – 2477.6 MHz  |  |
| RF Output Impedance:            | 50 Ohms  |  |
| Channel Spacing:                | 400kHz Frequency hopping / DTS mode different Channelization                                     |  |
| Duty Cycle:                     | Continuous   |  |
| Modulation Type:                | FHSS / DTS   |  |
| Antenna Connector Type:         | The MHX2421 Module is tested with MCX and Reverse Polarity SMA                                   |  |

## 3.4. ASSOCIATED ANTENNA DESCRIPTIONS

There are five antenna types:

- 1. Rubber Ducky Antenna
- 2. Transit Antenna
- 3. Patch Antenna
- 4. Yagi Antenna
- 5. Omni Directional Antenna

The highest gain antenna from each of the above antenna types were selected for testing to represents the worst-case. Refer to antennas list exhibit for detailed specifications.

## 3.5. LIST OF EUT'S PORTS

| Port<br>Number | EUT's Port Description | Number of<br>Identical Ports | Connector Type                           | Cable Type<br>(Shielded/Non-shielded)                  |
|----------------|------------------------|------------------------------|--|--|
| 1              | RF IN/OUT Port         | 1                            | Reversed SMA or MCX for external antenna | Shielded coaxial cable with unique coupling connectors |
| 2              | DC Supply & I/O Port   | 1                            | Pin Header                               | No cable, direct connection                            |

## 3.6. ANCILLARY EQUIPMENT

The EUT was tested while connected to the following representative configuration of ancillary equipment necessary to exercise the ports during tests:

| Ancillary Equipment # 1  |                     |  |
|--------------------------|---------------------|--|
| Description:             | Laptop              |  |
| Brand name:              | Toshiba             |  |
| Model Name or Number:    | 1605CDS/4.3         |  |
| FCC Certification        | FCC DoC             |  |
| Serial Number:           | 1027387CU           |  |
| Connected to EUT's Port: | Test Jig of the EUT |  |

| Ancillary Equipment # 2  |                        |  |
|--------------------------|------------------------|--|
| Description:             | Test Jig               |  |
| Brand name:              | Microhard Systems Inc. |  |
| Connected to EUT's Port: | I/O Port               |  |

| Ancillary Equipment # 3  |                     |
|--------------------------|---------------------|
| Description:             | AC Adaptor          |
| Brand name:              | Maxim               |
| Model Name or Number:    | MD4812112           |
| Connected to EUT's Port: | Test jig of the EUT |

## EXHIBIT 4. EUT OPERATING CONDITIONS AND CONFIGURATIONS DURING TESTS

### 4.1. CLIMATE TEST CONDITIONS

The climate conditions of the test environment are as follows:

| Temperature:        | 21°C        |
|---------------------|-------------|
| Humidity:           | 51%         |
| Pressure:           | 102 kPa     |
| Power Input Source: | 4 to 5.5VDC |

## 4.2. OPERATIONAL TEST CONDITIONS & ARRANGEMENT FOR TESTS

| Operating Modes:                  | <ul> <li>Each of lowest, middle and highest channel frequencies transmits continuously for emissions measurements.</li> <li>The EUT operates in normal Frequency Hopping mode for occupancy duration, and frequency separation.</li> </ul>   |
|-----------------------------------|--|
| Special Test Software & Hardware: | Special software provided by the Applicant is installed to allow the EUT to operate in hopping mode or at each channel frequency continuously. For example, the transmitter will be operated at each of lowest, middle and highest frequencies individually continuously during testing. |
| Transmitter Test Antenna:         | The EUT is tested with the antenna fitted in a manner typical of normal intended use as a non-integral antenna equipment as described with the test results.   |

| Transmitter Test Signals  |   |
|---|---|
| Frequency Band(s):  | 2401.6 – 2477.6                                     |
| Frequency(ies) Tested:<br>(Near lowest, near middle & near highest frequencies in | FHSS: 2401.6, 2439.6 and 2477.6 MHz                 |
| the frequency range of operation.)  | DTS: 2402.50, 2439.25 and 2476.00 MHz               |
|   | 2403.50, 2439.50 and 2475.50 MHz                    |
|   | 2404.00, 2440.25 and 2476.50 MHz                    |
|   | 2405.50, 2439.50 and 2473.50 MHz                    |
| <b>RF Power Output:</b><br>(measured maximum output power at antenna terminals)   | 1 Watt (conducted) and 36 dBm EIRP maximum          |
| *Normal Test Modulation:  | FHSS, Data Rate 5<br>DTS, Data Rate 8, 9, 10 and 11 |
| Modulating Signal Source:   | Internal  |

\*See Operational Description exhibit supplied by the manufacturer for details of the data rates for FHSS/DTS.

## EXHIBIT 5. SUMMARY OF TEST RESULTS

## 5.1. LOCATION OF TESTS

All of the measurements described in this report were performed at Ultratech Group of Labs located in the city of Oakville, Province of Ontario, Canada.

- AC Power Line Conducted Emissions were performed in UltraTech's shielded room, 24'(L) by 16'(W) by 8'(H).
- Radiated Emissions were performed at the Ultratech's 3-10 TDK Semi-Anechoic Chamber situated in the Town of Oakville, province of Ontario. This test site been calibrated in accordance with ANSI C63.4, and found to be in compliance with the requirements of Sec. 2.948 of the FCC Rules. The descriptions and site measurement data of the Oakville 3-10 TDK Semi-Anechoic Chamber has been filed with FCC office (FCC File No.: 31040/SIT 1300B3) and Industry Canada office (Industry Canada Site No.: 2049A-2, Expiry Date: July 4, 2008).

| FCC Section(s)   | Test Requirements   | Compliance<br>(Yes/No) |
|--|---|------------------------|
| 15.207(a)  | AC Power Line Conducted Emissions   | Yes                    |
| 15.247(a)(1), (f)  | Provisions for Frequency Hopping Systems  | Yes                    |
| 15.247(a)(2)   | 6 dB Bandwidth  | Yes                    |
| 15.247(b)(1)   | Peak Conducted Output Power - FHSS  | Yes                    |
| 15.247(b)(3)   | Peak Conducted Output Power - DTS   | Yes                    |
| 15.247(d)  | Band-Edge and RF Conducted Spurious Emissions at the Transmitter Antenna Terminal | Yes                    |
| 15.247(d), 15.209<br>& 15.205                              | Transmitter Spurious Radiated Emissions   | Yes                    |
| 15.247(e)  | Power Spectral Density  | Yes                    |
| 15.247(b)(5), (e)(i)<br>1.1307, 1.1310,<br>2.1091 & 2.1093 | RF Exposure   | Yes                    |

## 5.2. APPLICABILITY & SUMMARY OF EMC EMISSION TEST RESULTS

The digital circuit portion of the EUT has been tested and verified to comply with FCC Part 15, Subpart B, Class B Digital Devices. The engineering test report is available upon request.

# 5.3. MODIFICATIONS INCORPORATED IN THE EUT FOR COMPLIANCE PURPOSES

None.

## EXHIBIT 6. MEASUREMENTS, EXAMINATIONS & TEST DATA FOR EMC EMISSIONS

### 6.1. TEST PROCEDURES

ANSI C63.4; FCC Public Notice @ DA 00-705 (March 30, 2000) – Filing and Measurement Guidelines for Frequency Hopping Spread Spectrum Systems; KDB Publication No. 558074: Guidance on Measurements for Digital Transmission Systems.

## 6.2. MEASUREMENT UNCERTAINTIES

The measurement uncertainties stated were calculated in accordance with requirements of UKAS Document NIS 81 with a confidence level of 95%. Please refer to Exhibit 7 for Measurement Uncertainties.

### 6.3. MEASUREMENT EQUIPMENT USED

The measurement equipment used complied with the requirements of the Standards referenced in the Methods & Procedures ANSI C63.4 and CISPR 16-1-1

## 6.4. ESSENTIAL/PRIMARY FUNCTIONS AS DECLARED BY THE MANUACTURER

The essential function of the EUT is to correctly communicate data to and from radios over RF link.

### 6.5. COMPLIANCE WITH FCC PART 15 – GENERAL TECHNICAL REQUIREMENTS

| FCC Section | FCC Rules   | Manufacturer's Clarification  |
|-------------|---|---|
| 15.31       | The hoping function must be disabled for tests,<br>which should be performed with the EUT<br>transmitting on the number of frequencies<br>specified in this Section. The measurements<br>made at the upper and lower ends of the band<br>of operation should be made with the EUT<br>tuned to the highest and lowest available<br>channels.   | See Operational Description   |
| 15.203      | <ul> <li>Described how the EUT complies with the requirement that either its antenna is permanently attached, or that it employs a unique antenna connector, for every antenna proposed for use with the EUT.</li> <li>The exception is in those cases where EUT must be professionally installed. In order to demonstrate that professional installation is required, the following 3 points must be addressed:</li> <li>The application (or intended use) of the EUT</li> <li>The installation requirements of the EUT</li> <li>The method by which the EUT will be marketed</li> </ul> | The antenna employs unique antenna<br>connectors: MCX and Reverse Polarity<br>SMA |
| 15.204      | <ul> <li>Provided the information for every antenna proposed for use with the EUT:</li> <li>type (e.g. Yagi, patch, grid, dish, etc),</li> <li>manufacturer and model number</li> <li>gain with reference to an isotropic radiator</li> </ul>   | See proposed antenna list.  |
| 15.247(a)   | Description of how the EUT meets the definition of a frequency hopping spread spectrum, found in Section 2.1. Based on the technical description.   | See Operational Description   |
| 15.247(a)   | Pseudo Frequency Hopping Sequence:<br>Describe how the hopping sequence is<br>generated. Provide an example of the hopping<br>sequence channels, in order to demonstrate<br>that the sequence meets the requirements<br>specified in the definition of a frequency<br>hopping spread spectrum system, found in<br>Section 2.1   | See Operational Description   |

| FCC Section                | FCC Rules   | Manufacturer's Clarification |
|----------------------------|---|------------------------------|
| 15.247(a)                  | Equal Hopping Frequency Use:<br>Describe how each individual EUT meets the<br>requirement that each of its hopping channels is<br>used equally on average (e.g. that each new<br>transmission event begins on the next channel in<br>the hopping sequence after final channel used in<br>the previous transmission events). | See Operational Description  |
| 15.247(g)                  | Describe how the EUT complies with the<br>requirement that it be designed to be capable of<br>operating as a true frequency hopping system  | See Operational Description  |
| 15.247(h)                  | Describe how the EUT complies with the<br>requirement that it not have the ability to<br>coordinated with other FHSS is an effort to avoid<br>the simultaneous occupancy of individual hopping<br>frequencies by multiple transmitters  | See Operational Description  |
| Public Notice<br>DA 00-705 | System Receiver Input Bandwidth:<br>Describe how the associated receiver(s) complies<br>with the requirement that its input bandwidth<br>(either RF or IF) matches the bandwidth of the<br>transmitted signal.  | See Operational Description  |
| Public Notice<br>DA 00-705 | System Receiver Hopping Capability:<br>Describe how the associated receiver(s) has the<br>ability to shift frequencies in synchronization with<br>the transmitted signals   | See Operational Description  |

## 6.6. POWER LINE CONDUCTED EMISSIONS [§15.207(a)]

### 6.6.1. Limit

The equipment shall meet the limits of the following table:

| Frequency of emission     | Conducted Limits (dBµV)<br>Quasi-peak Average |                       |  |
|---------------------------|---|-----------------------|--|
| (MHz)                     |   |                       | Measuring Bandwidth  |

## 6.7. PROVISIONS FOR FREQUENCY HOPPING SYSTEMS [§ 15.247(a)(1)]

### 6.7.1. Limit

**§ 15.247(a)(1)**: Frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25 kHz or the 20 dB bandwidth of the hopping channel, whichever is greater. Alternatively, frequency hopping systems operating in the 2400-2483.5 MHz band may have hopping channel carrier frequencies that are separated by 25 kHz or two-thirds of the 20 dB bandwidth of the hopping channel, whichever is greater, provided the systems operate with an output power no greater than 125 mW. The system shall hop to channel frequencies that are selected at the system hopping rate from a pseudorandomly ordered list of hopping frequencies. Each frequency must be used equally on the average by each transmitter. The system receivers shall have input bandwidths that match the hopping channel bandwidths of their corresponding transmitters and shall shift frequencies in synchronization with the transmitted signals.

**§ 15.247(a)(1)(iii)**: Frequency hopping systems in the 2400–2483.5 MHz band shall use at least 15 channels. The average time of occupancy on any channel shall not be greater than 0.4 seconds within a period of 0.4 seconds multiplied by the number of hopping channels employed. Frequency hopping systems may avoid or suppress transmissions on a particular hopping frequency provided that a minimum of 15 channels are used.

#### 6.7.2. Method of Measurements

FCC Public Notice DA 00-705

#### Carrier Frequency Separation:

The hopping function of the EUT is enabled. Use the spectrum analyzer setting as follows:

- Span = wide enough to capture the peaks of two adjacent channels
- RBW = 1% of the span
- VBW <u>></u> RBW
- Sweep = Auto
- Detector = peak
- Trace = max hold

#### Number of hopping frequency:

The hopping function of the EUT is enabled. Use the spectrum analyzer setting as follows:

- Span = the frequency band of operation
- RBW = 1% of the span
- VBW <u>></u> RBW
- Sweep = Auto
- Detector = peak
- Trace = max hold

#### Time of Occupancy (Dwell Time):

The hopping function of the EUT is enabled. Use the spectrum analyzer setting as follows:

- Span = 0 Hz centered on a hopping channel
- RBW = 1 MHz
- VBW > RBW
- Sweep = as necessary to capture the entire dwell time per hopping channel
- Detector = peak
- Trace = max hold

If possible, use the marker-delta function to determine the dwell time. If this value varies with different modes of operation (e.g. date rate modulation format, etc.), repeat this test for each variation. The limit is specified in one of the subparagraphs of this Section. Submit this plot(s). An oscilloscope may be used instead of a spectrum analyzer.

#### 20 dB Bandwidth:

Use the spectrum analyzer setting as follows:

- Span = approximately 2 to 3 times the 20 dB bandwidth, centered on a hopping channel
- RBW = 1% of the 20 dB bandwidth
- VBW > RBW
- Sweep = auto
- Detector = peak
- Trace = max hold
- The transmitter shall be transmitting at its maximum data rate.
- Allow the trace to stabilize.
- Use the marker-to-peak function to set the marker to the peak of the emission.
- Use the marker-delta function to measure 20 dB down on both sides of the emission.
- The 20 dB BW is the delta reading in frequency between two markers.

#### 6.7.3. Test Arrangement

120 VAC 60 Hz

### 6.7.4. Test Equipment List

| Test Instruments  | Manufacturer    | Model No.     | Serial No. | Frequency Range |

## 6.9. PEAK CONDUCTED OUTPUT POWER - FHSS [§ 15.247(b)(2)]

#### 6.9.1. Limit

**§15.247(b)(1):** For frequency hopping systems operating in the 2400–2483.5 MHz band employing at least 75 non-overlapping hopping channels, and all frequency hopping systems in the 5725–5850 MHz band: 1 watt. For all other frequency hopping systems in the 2400–2483.5 MHz band: 0.125 watts.

**§15.247(b)(4):** The conducted output power limit specified in paragraph (b) of this section is based on the use of antennas with directional gains that do not exceed 6 dBi. Except as shown in paragraph (c) of this section, if transmitting antennas of directional gain greater than 6 dBi are used, the conducted output power from the intentional radiator shall be reduced below the stated values in paragraphs (b)(1), (b)(2), and (b)(3) of this section, as appropriate, by the amount in dB that the directional gain of the antenna exceeds 6 dBi.

**§15.247(b)(4)(i):** Systems operating in the 2400–2483.5 MHz band that are used exclusively for fixed, point-to-point operations may employ transmitting antennas with directional gain greater than 6 dBi provided the maximum peak output power of the intentional radiator is reduced by 1 dB for every 3 dB that the directional gain of the antenna exceeds 6 dBi.

#### 6.9.2. Method of Measurements

Refer to Exhibit 8, Section 8.3, FCC Public Notice DA 00-705 and ANSI C63.4.

#### 6.9.3. Test Arrangement

120 VAC 60 Hz

### 6.9.4. Test Equipment List

| Test Instruments  | Manufacturer    | Model No.     | Serial No. | Frequency Range |
|-------------------|-----------------|---------------|------------|-----------------|
| Spectrum Analyzer | Rhode & Schwarz | FSEK20/B4/B21 | 834157/005 | 9kHz - 40GHz    |
| Attenuator        | Narda           | 4768-10       | 0702       | DC -40GHz       |

| Power Setting: 0 dBm (1 mW) |                    |   |                             |                                     |                     |
| Lowest                      | 2401.6             | -0.62   | See Notes below             | 30.0                                | 36.0                |
| Middle                      | 2439.6             | 0.27  | See Notes below             | 30.0                                | 36.0                |
| Highest                     | 2477.6             | 0.54  | See Notes below             | 30.0                                | 36.0                |

Notes:

- 1. The EIRP shall be calculated based on the transmitter antenna gain ( $G_{dBi}$ ), cable loss ( $CL_{dB}$ ) and peak output power at antenna terminal ( $P_{dBm}$ ). Calculated EIRP =  $P_{dBm} + G_{dBi} CL_{dB}$
- 2. EIRP shall not exceed 36 dBm limit (Power Setting = 36 dBm G<sub>dBi</sub> + CL<sub>dB</sub>). See page 2 of the Operating Manual for instruction of power setting.

## 6.10. PEAK CONDUCTED OUTPUT POWER - DTS [§ 15.247(b)(3)]

#### 6.10.1. Limits

- § 15.247(b)(3): For systems using digital modulation in the 902-928 MHz, 2400-2483.5 MHz, and 5725-5850 MHz bands: 1 Watt. As an alternative to a peak power measurement, compliance with the one Watt limit can be based on a measurement of the maximum conducted output power. Maximum Conducted Output Power is defined as the total transmit power delivered to all antennas and antenna elements averaged across all symbols in the signaling alphabet when the transmitter is operating at its maximum power control level. Power must be summed across all antennas and antenna elements. The average must not include any time intervals during which the transmitter is off or is transmitting at a reduced power level. If multiple modes of operation are possible (e.g., alternative modulation methods), the maximum conducted output power is the highest total transmit power occurring in any mode.
- §15.247(b)(4): The conducted output power limit specified in paragraph (b) of this section is based on the use of antennas with directional gains that do not exceed 6 dBi. Except as shown in paragraph (c) of this section, if transmitting antennas of directional gain greater than 6 dBi are used, the conducted output power from the intentional radiator shall be reduced below the stated values in paragraphs (b)(1), (b)(2), and (b)(3) of this section, as appropriate, by the amount in dB that the directional gain of the antenna exceeds 6 dBi.

#### 6.10.2. Method of Measurements & Test Arrangement

KDB Publication No. 558074: Guidance on Measurements for Digital Transmission Systems (47 CFR 15.247)

## 6.10.3. Test Arrangement

120 VAC 60 Hz

#### 6.10.4. Test Equipment List

| Test Instruments  | Manufacturer    | Model No.     | Serial No. | Frequency Range |
|-------------------|-----------------|---------------|------------|-----------------|
| Spectrum Analyzer | Rhode & Schwarz | FSEK20/B4/B21 | 834157/005 | 9 kHz- 40 GHz   |
| Attenuator        | Narda           | 4768-10       | 0702       | DC -40GHz       |

## 6.10.5. Test Data

Remark: Test Method: Option 2, method 1.

Notes:

- 1. The EIRP shall be calculated based on the transmitter antenna gain ( $G_{dBi}$ ), cable loss ( $CL_{dB}$ ) and peak output power at antenna terminal ( $P_{dBm}$ ). Calculated EIRP =  $P_{dBm} + G_{dBi} CL_{dB}$
- 2. EIRP shall not exceed 36 dBm limit (Power Setting = 36 dBm G<sub>dBi</sub> + CL<sub>dB</sub>). See page 2 of the Operating Manual for instruction of power setting.

## 6.11. TRANSMITTER BAND-EDGE & SPURIOUS CONDUCTED EMISSIONS [§ 15.247(d)]

#### 6.11.1. Limit

**§ 15.247 (d)**: In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in § 15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in § 15.205(a), must also comply with the radiated emission limits specified in § 15.209(a) (see § 15.205(c)).

#### 6.11.2. Method of Measurements

- FCC Public Notice DA 00-705
- KDB Publication No. 558074: Guidance on Measurements for Digital Transmission Systems (47 CFR 15.247).

#### 6.11.3. Test Arrangement

120 VAC 60 Hz

### 6.11.4. Test Equipment List

| Test Instruments  | Manufacturer    | Model No.          | Serial No. | Frequency Range |
|-------------------|-----------------|--------------------|------------|-----------------|
| Spectrum Analyzer | Rhode & Schwarz | FSEK20/B4/B21      | 834157/005 | 9kHz - 40GHz    |
| High Pass Filter  | K&L             | 11SH10-4000/T12000 | 4          | 1 - 26 GHz      |
| Attenuator        | Narda           | 4768-10            | 0702       | DC -40GHz       |

# 6.12. TRANSMITTER SPURIOUS RADIATED EMISSIONS AT 3 METERS [§§ 15.247(d), 15.209 & 15.205]

# 6.12.1. Limit

**§ 15.247 (d)**: In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in § 15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in § 15.205(a), must also comply with the radiated emission limits specified in § 15.209(a) (see § 15.205(c)).

Section 15 200(a)

# 6.12.2. Method of Measurements

ANSI 63.4 for detailed radiated emissions measurement procedures.

The following measurement procedures were also applied:

- Applies to harmonics/spurious that fall in the restricted bands listed in Section 15.205. the maximum
  permitted average field strength is listed in Section 15.209. A Pre-Amp and highpass filter are used for this
  measurement.
- For measurement below 1 GHz, set RBW = 100 KHz, VBW ≥ 100 KHz, SWEEP=AUTO.
- For measurement above 1 GHz, set RBW = 1 MHz, VBW = 1 MHz (Peak) & VBW = 10 Hz (Average), SWEEP=AUTO.
- If the emission is pulsed, modified the unit for continuous operation, then use the settings above for measurements, then correct the reading by subtracting the peak-average correction factor derived from the appropriate duty cycle calculation. See Section 15.35(b) and (c).

# 6.12.3. Test Arrangement

120 VAC 60 Hz

# 6.12.4. Test Equipment List

| Test Instruments       | Manufacturer    | Model No.     | Serial No. | Frequency Range   |

# 6.13. POWER SPECTRAL DENSITY [§ 15.247(e)]

## 6.13.1. Limits

For digitally modulated systems, the power spectral density conducted from the intentional radiator to the antenna shall not be greater than 8 dBm in any 3 kHz band during any time interval of continuous transmission.

## 6.13.2. Method of Measurements

KDB Publication No. 558074: Guidance on Measurements for Digital Transmission Systems (47 CFR 15.247).

## 6.13.3. Test Arrangement

120 VAC 60 Hz

# 6.13.4. Test Equipment List

| Test Instruments  | Manufacturer    | Model No.     | Serial No. | Frequency Range |
|-------------------|-----------------|---------------|------------|-----------------|
| Spectrum Analyzer | Rhode & Schwarz | FSEK20/B4/B21 | 834157/005 | 9 kHz- 40 GHz   |
| Attenuator        | Narda           | 4768-10       | 0702       | DC -40GHz       |

## 6.13.5. Test Data

| Frequency<br>(MHz) | Modulation<br>Data Rate | *PSD<br>in 3 kHz BW<br>(dBm) | Limit<br>(dBm) | Margin<br>(dB) |
|--------------------|-------------------------|------------------------------|----------------|----------------|

# 6.14. RF EXPOSURE REQUIRMENTS [§§ 15.247(i), 1.1310 & 2.1091]

### 6.14.1. Limit

- § 15.247(i): Systems operating under provisions of this section shall be operated in a manner that ensures that the public is not exposed to radio frequency energy levels in excess of the Commission's guidelines. See § 1.1307(b)(1).
- § 1.1310:- The criteria listed in the following table shall be used to evaluate the environmental impact of human exposure to radio-frequency (RF) radiation as specified in 1.1307(b).

| Frequency range<br>(MHz)                                  | Electric field<br>strength<br>(V/m) | Magnetic field<br>strength<br>(A/m) | Power density<br>(mW/cm <sup>2</sup> )                   | Averaging time<br>(minutes)      |  |  |  |

|--|---------------|---------------|-------------|----------|------|
|--|---------------|---------------|-------------|----------|------|

f = frequency in MHz

f = frequency in MHz
\* = Plane-wave equivalent power density
NOTE 1 TO TABLE 1: Occupational/controlled limits apply in situations in which persons are exposed as a consequence of their employment provided those persons are fully aware of the potential for exposure and can exercise control over their exposure.
Limits for occupational/controlled exposure also apply in situations when an individual is transient through a location where occupational/controlled limits apply provided he or she is made aware of the potential for exposure.
NOTE 2 TO TABLE 1: General population/uncontrolled exposure apply in situations in which the general public may be exposed, or in which persons that are exposed as a consequence of their employment may not be fully aware of the potential for exposure or can not exercise control over their exposure.

# 6.14.2. Method of Measurements

Refer to Sections 1.1310, 2.1091 and Public Notice DA 00-705 (March 30, 2000)

Spread spectrum transmitters operating under section 15.247 are categorically from routine environmental evaluation to demonstrating RF exposure compliance with respect to MPE and/or SAR limits. These devices are not exempted from compliance (As indicated in Section 15.247(b)(4), these transmitters are required to operate in a manner that ensures that exposure to public users and nearby persons) does not exceed the Commission's RF exposure guidelines (see Section 1.1307 and 2.1093). Unless a device operates at substantially low power levels, with a low gain antenna(s), supporting information is generally needed to establish the various potential operating configurations and exposure conditions of a transmitter and its antenna(s) in order to determine compliance with the RF exposure guidelines.

In order to demonstrate compliance with MPE requirements (see Section 2.1091), the following information is typically needed:

- (1) Calculation that estimates the minimum separation distance (20 cm or more) between an antenna and persons required to satisfy power density limits defined for free space.
- (2) Antenna installation and device operating instructions for installers (professional/unskilled users), and the parties responsible for ensuring compliance with the RF exposure requirement
- (3) Any caution statements and/or warning labels that are necessary in order to comply with the exposure limits
- (4) Any other RF exposure related issues that may affect MPE compliance

#### Calculation Method of RF Safety Distance:

 $S = PG/4\Pi r^2 = EIRP/4\Pi r^2$ 

Where:P: power input to the antenna in mWEIRP: Equivalent (effective) isotropic radiated powerS: power density mW/cm²G: numeric gain of antenna relative to isotropic radiatorr: distance to centre of radiation in cm

$$r = \sqrt{EIRP/4\Pi S}$$

For portable transmitters (see Section 2.1093), or devices designed to operate next to a person's body, compliance is determined with respect to the SAR limit (define in the body tissues) for near-field exposure conditions. If the maximum average output power, operating condition configurations and exposure conditions are comparable to those of existing cellular and PCS phones, SAR evaluation may be required in order to determine if such a device complies with SAR limit. When SAR evaluation data is not available, and the additional supporting information cannot assure compliance, the Commission may request that an SAR evaluation be performed, as provided for in Section 1.1307(d)

# 6.14.3. Test Data

| Evaluation of RF Exposure Compliance Requirements   |   |  |  |  |  |
|---|---|--|--|--|--|
| RF Exposure Requirements  | Compliance with FCC Rules   |  |  |  |  |
| Minimum calculated separation distance between antenna and persons required: <b>*18 cm</b>  | Manufacturer' instruction for separation distance between antenna and persons required: 23 cm.  |  |  |  |  |
| Antenna installation and device operating<br>instructions for installers (professional/unskilled<br>users), and the parties responsible for ensuring<br>compliance with the RF exposure requirement | Antenna installation and device operating instructions<br>shall be provided to installers to maintain and ensure<br>compliance with RF exposure requirements. |  |  |  |  |
| Caution statements and/or warning labels that are necessary in order to comply with the exposure limits   | Refer to User's Manual for RF Exposure Information.   |  |  |  |  |
| Any other RF exposure related issues that may affect MPE compliance   | None.   |  |  |  |  |

\*The minimum separation distance between the antenna and bodies of users are calculated using the following formula:

RF EXPOSURE DISTANCE LIMITS:  $r = (PG/4\Pi S)^{1/2} = (EIRP/4\Pi S)^{1/2}$ 

S = 1 mW/cm<sup>2</sup> EIRP = 36.0 dBm =  $10^{36/10}$  mW max. (Worst Case)

r =  $(EIRP/4\Pi S)^{1/2}$  =  $(10^{36/10}/4\Pi(1))^{1/2}$  = 18 cm

# EXHIBIT 7. MEASUREMENT UNCERTAINTY

The measurement uncertainties stated were calculated in accordance with the requirements of NIST Technical Note 1297 and NIS 81 (1994)

# 7.1. LINE CONDUCTED EMISSION MEASUREMENT UNCERTAINTY

| CONTRIBUTION  | PROBABILITY    | UNCERTA       | INTY (dB)     |
|---|----------------|---------------|---------------|
| (Line Conducted)                                    | DISTRIBUTION   | 9-150 kHz     | 0.15-30 MHz   |
| EMI Receiver specification                          | Rectangular    | <u>+</u> 1.5  | <u>+</u> 1.5  |
| LISN coupling specification                         | Rectangular    | <u>+</u> 1.5  | <u>+</u> 1.5  |
| Cable and Input Transient Limiter calibration       | Normal (k=2)   | <u>+</u> 0.3  | <u>+</u> 0.5  |
| Mismatch: Receiver VRC $\Gamma_1$ = 0.03            |                |               |               |
| LISN VRC Γ <sub>R</sub> = 0.8(9 kHz) 0.2 (30        |                |               |               |
| MHz)  | U-Shaped       | <u>+</u> 0.2  | <u>+</u> 0.3  |
| Uncertainty limits $20Log(1 \pm \Gamma_1 \Gamma_R)$ |                |               |               |
| System repeatability                                | Std. deviation | <u>+</u> 0.2  | <u>+</u> 0.05 |
| Repeatability of EUT                                |                |               |               |
| Combined standard uncertainty                       | Normal         | <u>+</u> 1.25 | <u>+</u> 1.30 |
| Expanded uncertainty U                              | Normal (k=2)   | <u>+</u> 2.50 | <u>+</u> 2.60 |

Sample Calculation for Measurement Accuracy in 450 kHz to 30 MHz Band:

 $u_{c}(y) = \sqrt{\sum_{i=1}^{m} u_{i}^{2}(y)} = \pm \sqrt{(1.5^{2} + 1.5^{2})/3 + (0.5/2)^{2} + (0.05/2)^{2} + 0.35^{2}} = \pm 1.30 \text{ dB}$ 

 $U = 2u_c(y) = + 2.6 \text{ dB}$ 

# 7.2. RADIATED EMISSION MEASUREMENT UNCERTAINTY

| CONTRIBUTION  | PROBABILITY    | UNCERTAINTY ( <u>+</u> dB) |               |  |
|---|----------------|----------------------------|---------------|--|
| (Radiated Emissions)  | DISTRIBUTION   | 3 m                        | 10 m          |  |
| Antenna Factor Calibration  | Normal (k=2)   | <u>+</u> 1.0               | <u>+</u> 1.0  |  |
| Cable Loss Calibration  | Normal (k=2)   | <u>+</u> 0.3               | <u>+</u> 0.5  |  |
| EMI Receiver specification  | Rectangular    | <u>+</u> 1.5               | <u>+</u> 1.5  |  |
| Antenna Directivit  | Rectangular    | +0.5                       | +0.5          |  |
| Antenna factor variation with height  | Rectangular    | <u>+</u> 2.0               | <u>+</u> 0.5  |  |
| Antenna phase center variation  | Rectangular    | 0.0                        | <u>+</u> 0.2  |  |
| Antenna factor frequency interpolation  | Rectangular    | <u>+</u> 0.25              | <u>+</u> 0.25 |  |
| Measurement distance variation  | Rectangular    | <u>+</u> 0.6               | <u>+</u> 0.4  |  |
| Site imperfections  | Rectangular    | <u>+</u> 2.0               | <u>+</u> 2.0  |  |
| Mismatch: Receiver VRC $\Gamma_1$ = 0.2<br>Antenna VRC $\Gamma_R$ = 0.67(Bi) 0.3 (Lp)<br>Uncertainty limits 20Log(1 <u>+</u> $\Gamma_1\Gamma_R$ ) | U-Shaped       | +1.1<br>-1.25              | <u>+</u> 0.5  |  |
| System repeatability  | Std. Deviation | <u>+</u> 0.5               | <u>+</u> 0.5  |  |
| Repeatability of EUT  |                | -                          | -             |  |
| Combined standard uncertainty   | Normal         | +2.19 / -2.21              | +1.74 / -1.72 |  |
| Expanded uncertainty U  | Normal (k=2)   | +4.38 / -4.42              | +3.48 / -3.44 |  |

Calculation for maximum uncertainty when 3m biconical antenna including a factor of k = 2 is used:

 $U = 2u_c(y) = 2x(+2.19) = +4.38 \text{ dB}$  And  $U = 2u_c(y) = 2x(-2.21) = -4.42 \text{ dB}$
