Section 1. Summary of Test Results

Manufacturer: **Communication Components, Inc.**

Model No.: **BDA-8087-52**

Serial No.: **0052**

General: **All measurements are traceable to national standards.**

These tests were conducted on a sample of the equipment for the purpose of demonstrating compliance with FCC Part 90, Subpart I.

Transient Frequency Behavior	90.214	N/A	N/A	N/A

Footnotes For N/A's:

- (1) Since the E.U.T. does not contain modulation circuitry modulation testing was not performed.
- (2) Since the E.U.T. only amplifies the signal it receives, Frequency Stability was not tested.
- (3) Since the E.U.T. is not a keyed carrier system, Transient Frequency Behavior was not performed.

Description of Modifications For Class II Permissive Change

Automatic Gain Control (AGC) option was added to the uplink amplifier circuit. The amplifier was not modified in any other way. The rf power output is not altered by the modification except that the power output is limited based on the setting of the AGC threshold. The AGC threshold was set to the maximum rf output intended for operation. The rf power may be slightly lower than listed in the original approval but will never exceed the originally granted power output since the testing for the original approval was based on testing performed on the same amplifier without AGC circuit.

Modifications Made During Testing

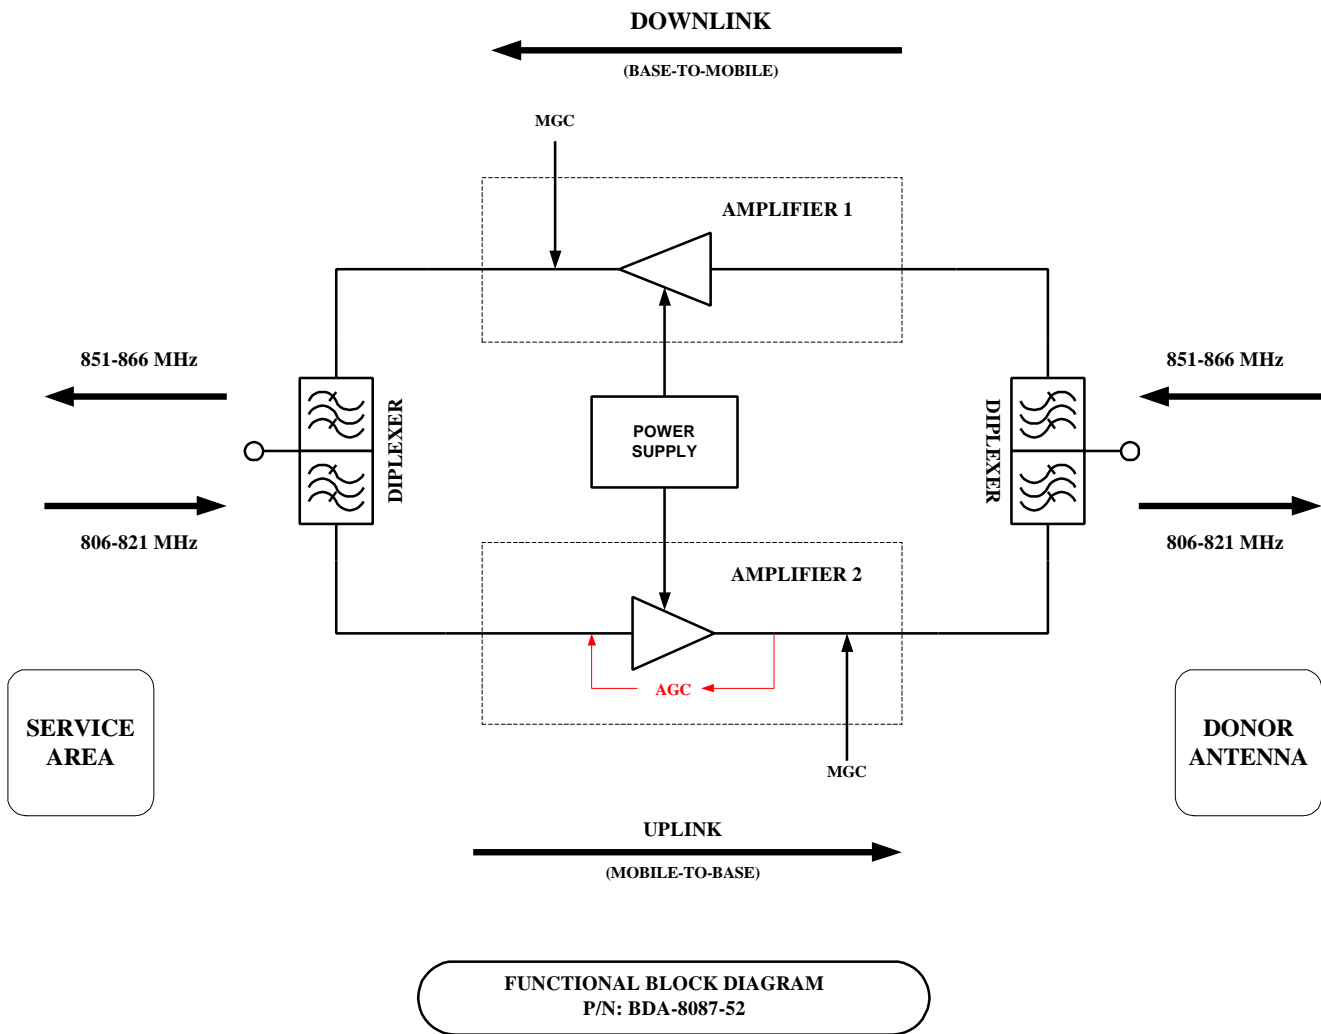

None

Description of Operation

The BDA is a Bi-directional amplifier designed to operate in the Specialized Mobile Radio (SMR) bands. It is designed to exchange radio communications in buildings, basements, tunnels, and other RF shielded environments. It improves the sensitivity of base stations in indoor locations where there is a significant amount of cable loss in RF distribution systems.

It contains two amplifiers providing amplification of RF signals in Uplink and Downlink frequency bands. They are connected to the external cables via frequency selective duplexers in order to attenuate all signals that are not in the designated bands.

Section 3. RF Power Output

NAME OF TEST: RF Power Output	PARA. NO.: 2.985
TESTED BY: David Light	DATE: 10/5/00

Test Results: Complies.

Measurement Data: Note: The radiated output power listed in the tables below relates to the rf output power granted in the original approval and listed on the grant of certification. Testing was performed with the maximum rf input power fed to the amplifier.

ANNEX A - TEST METHODOLOGIES

NAME OF TEST: RF Power Output	PARA. NO.: 2.985
--------------------------------------	-------------------------

Minimum Standard: Para. No. 90.205(a). The maximum allowable station ERP is dependent upon the stations HAAT and required service area and will be authorized in accordance with Table 1 of 90.205(d).

Method Of Measurement:

Detachable Antenna:

The peak power at antenna terminals is measured using an in-line peak power meter. Power output is measured with the maximum rated input level.

Integral Antenna:

If the antenna is not detachable from the circuit then the Peak Power Output is derived from the peak radiated field strength of the fundamental emission by using the plane wave relation $GP/4\pi R^2 = E^2/120\pi$ and proceeding as follows:

$$P = \frac{E^2 R^2}{30G} = \frac{E^2 3^2}{30G}$$

where,

P = the equivalent isotropic radiated power in watts

E = the maximum measured field strength in V/m

R = the measurement range (3 meters)

G = the numeric gain of the transmit antenna in relation to an isotropic radiator

NAME OF TEST: Field Strength of Spurious **PARA. NO.: 2.993**

Minimum Standard: Para. No. 90.210, see table 1 for applicable mask.

Calculation of Field Strength Limit

An example of attenuation requirement of $50 + 10 \text{ Log } P$ is equivalent to -20 dBm (1×10^{-5} Watts) at the antenna terminal. We determine the field strength limit by using the plane wave relation.

$$GP/4\pi R^2 = E^2/120\pi$$

For emissions ≤ 1 GHz:

- G = 1.64 (Dipole Gain)
- P = 10^{-5} Watts (Maximum spurious output power)
- R = 3m (Measurement Distance)

$$E = \frac{\sqrt{30GP}}{R} = E = \frac{\sqrt{30 \times 1.64 \times 10^{-5}}}{3} = 0.00739 \text{ V / m} = 77.4 \text{ dBmV / m}$$

For emissions > 1 GHz:

- G = 1 (Isotropic Gain)
- P = 1×10^{-5} Watts (Maximum spurious output power)
- R = 3m (Measurement Distance)

$$E = 77.4 - 20 \text{ Log } \sqrt{1.64} = 75.2 \text{ dBmV / m@3m}$$

MASK	Spurious Limit	FS Limit Below 1 GHz	FS Limit Above 1 GHz
A,B,C,G,H,I	-13dBm	84.4 dBμV/m@3m	82.2 dBμV/m@3m
D,J	-20dBm	77.4 dBμV/m@3m	75.2 dBμV/m@3m
