

### Exposure limit according to §15.247(i) and §1.1307

The device is classified as mobile.

Limit for power density for general population/uncontrolled exposure is  $f/1500 \text{ mW/cm}^2$  for 300 – 1500 MHz frequency range:

$$P = 905/1500 = 0.6 \text{ mW/cm}^2$$

The power density  $P \text{ (mW/cm}^2) = P_T / 4\pi r^2$

$P_T$  is the transmitted power, which is equal to the peak transmitter output power 19.2 dBm plus maximum antenna gain 0 dBi, the maximum equivalent isotropically radiated power EIRP is

$$P_T = 19.2 \text{ dBm} = 83.2 \text{ mW}.$$

The power density at 20 cm (minimum safe distance, required for mobile devices), calculated as follows:

$$83 \text{ mW} / 4\pi (20 \text{ cm})^2 = 0.016 \text{ mW/cm}^2 \ll 0.6 \text{ mW/cm}^2$$

General public cannot be exposed to dangerous RF level.
