RF Transmitter Installation Instructions

The Propane Gauge Monitor Transmitter is a member of our Spread Spectrum RF family of products. This transmitter should only be installed by qualified service personnel.

The transmitter detects level, low battery or other data signals from the external binary inputs and broadcasts that data to the system's host receiver.

MOUNTING LOCATION

The Propane Gauge Monitor Transmitter is a device as defined by the FCC and must be enclosed within its plastic housing. In order to function as a propane gauge monitor transmitter the device must be connected to the external level-sensing gauge using the connector molded into the lower housing.

INSTALLATION INSTRUCTIONS

1. Supply the transmitter with DC power by removing the external magnet from the slot in the housing.
2. The unit will come pre-programmed with Transmitter ID and Property Code. There will be no field programming of the unit.
3. Install the monitor on the top of the propane tank to be queried using the magnetic base of the transmitter. Do not install the transmitter under the hinged metal protective cap of the propane tank. Install the remote level-sensing gauge and connect the wire harness to the transmitter via the connector molded into the device housing.

NOTE: When installing the Propane Gauge Monitor transmitter you should avoid areas near screens, metal window frames, circuit breaker boxes, air conditioners and heaters if a suitable location for the unit may be found elsewhere.

CAUTION:

This device is required to comply with FCC RF exposure requirements for mobile transmitting devices. A separation of 20 cm (8 inches) or more must be maintained between the antenna and all persons during device operations to satisfy RF exposure compliance.

TESTING THE TRANSMITTER

Following system installation, system testing is mandatory. This should be performed by locating the Propane Gauge Monitor Transmitter in its final location and powering up the unit. On initial power-up, the transmitter will send out RF messages every 4 seconds or more depending on programming. This will establish communications with the Host receiver and the information collected will then be used to judge system performance.

FCC NOTICE

The Propane Gauge Monitor transmitter generates and uses radio frequency energy. If not installed and used in accordance with the manufacturer's instructions, it may cause interference to radio and television reception. The transmitter has been tested and found to comply with the specifications in Part 15 of FCC Rules for Spread Spectrum Intentional Radiators and FCC Part 15 Subpart C, Specifications.

If this equipment causes interference to radio or television reception - which can be determined by turning the equipment on and off - the installer is encouraged to correct the interference by one or more of the following measures: 1) Reorient the antenna of the radio/television. 2) Connect the AC transformer to a different outlet so the receiver and radio/television are on different branch circuits. 3) Relocate the Host receiver with respect to the radio/television.

If necessary, the installer should consult an experienced radio/television technician for additional suggestions, or send for the "Interference Handbook" prepared by the Federal Communications Commission. This booklet is available from the U.S. Government Printing Office, Washington, D.C., 20402, by stock number 004-000-00450-7.

CAUTION: Robertshaw Industrial Products Division does not support field changes or modifications to any of the Robertshaw Industrial Products Division RF equipment unless they are specifically covered in this manual. All adjustments must be made at the factory under the specific guidelines set forth in our manufacturing processes. Any modification to the equipment could void the user's authority to operate the equipment and render the equipment in violation of FCC Part 15, Subpart C, 15.247.

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.
