The revised Users Manual shows an SAR of 1.16 W/kg for body worn use. This is not confirmed by the SAR report. Please clarify.

Frank,

At first look, I noticed this was a typo. Then I thought that you may have the wrong SAR report. The maximum Head SAR value is correct but I want to make sure. One of my employees, that is out having surgery, did the original filling and may have uploaded a prototype report that was done before all of the filing data was taken. I have reviewed all of the exhibits in the NWJ10A003A filing and they are correct but I want to make sure the SAR report is the correct one. I have attached the SAR report, radiated report and the corrected section of the OI.

The SAR values are as follows:

Mode	Conducted power in dBm	Head SAR W/kg	Body SAR W/kg
AMPS	22.6	1.51	0.382
TDMA	27.4	1.48	0.359
PCS	26.4	1.49	0.747

If the SAR report you have conflicts with these results, then it is not correct. The attached report is correct.

Pieter
