

07 November 2003

**TEST - REPORT**

**No. 51905-30600-8**

**for**

**MOBY I SLG 40S**

**TAG Reader System**

Applicant: Siemens AG, Fürth

Purpose of testing: To show compliance with

FCC Code of Federal Regulations,  
CFR 47, Part 15, Subpart C,  
Sections 15.205, 15.207 and 15.209

Industry Canada Radio Standards  
Specification RSS-210 Issue 5,  
Sections 6.2.1, 6.3, 6.6  
(Category I Equipment)

---

**Note:**

The test data of this report relate only to the individual item which has been tested. This report shall not be reproduced except in full extent without the written approval of the testing laboratory.

## 1. Administrative Data

Equipment Under Test (EUT): MOBY I SLG 40S  
Serial number(s): ---  
Type of equipment: TAG Reader System  
Type of emission: 10K0A1D  
Parts/accessories: ---  
FCC-ID:

---

Applicant:  
(full address) Siemens AG, Fürth  
Würzburger Str. 121  
D-90766 Fürth

Contract identification: ---

Contact person: Mr. Horst

Manufacturer: Siemens AG, Fürth

---

Receipt of EUT: 22 September 2003

Dates of test: 22 September to 04 November 2003

Note: ---

---

Responsible for testing: Thomas Eberl

Responsible for test report: Thomas Eberl

## 2. Identification of Test Laboratory

Test Laboratory: Senton GmbH EMI/EMC Test Center  
(full address): Aeussere Fruehlingstrasse 45  
D-94315 Straubing  
Germany

---

Contact person: Mr. Johann Roidt  
Communication: Telephone (+49) 0 94 21 / 55 22-0  
Fax (+49) 0 94 21 / 55 22-99  
eMail: Office@senton.de

---

FCC registration number: 90926  
Industry Canada file number: IC 3050

### 3. Summary of Test Results

The tested sample complies with the requirements for set forth in the

**The Code of Federal Regulations 47, Part 15, Subpart C, Sections 15.205, 15.207  
and 15.209**

of the Federal Communication Commission (FCC) and the

**Radio Standards Specification RSS-210 Issue 5, Sections 6.2.1, 6.3 and 6.6 for Low  
Power Licence-Exempt Radiocommunication Devices**

of Industry Canada (IC).

Johann Roidt  
Laboratory Manager

Thomas Eberl  
Test Engineer

#### **4. Deviations from the Test Specifications**

All tests were performed without deviations from the test specifications.

**5. Operation Mode of EUT**

Continuously reading appropriate TAG

## 6. Configuration of EUT and Peripheral Devices

### Configuration of cables of EUT

DASM IF cable - shielded  
Parallel IF cable - shielded

### Configuration of peripheral devices connected to EUT

Interface converter box DASM 420 F  
Laptop PC HP OmniBook 4150  
AC/DC Adapter HP F1454A  
Printer HP 2225C  
AC Adapter Hayes

## 7. Measuring Methods

### 7.1. Conducted powerline emissions

Rules and Specifications:	Sections 15.107 & 15.207
Guide:	CISPR 22

**Measurement Procedure:**

In general conducted emission tests in the frequency range 0.15 - 30 MHz are required to be performed with quasi-peak and average detector. To simplify testing the following procedure is used:

First the whole spectrum of emission caused by equipment under test (EUT) is recorded with detector set to peak. After that all emission levels having less margin than 20 dB to or exceeding the appropriate limit (in general average limit is 10 dB lower than quasi-peak limit) are retested with detector set to quasi-peak. If average limit is kept no additional scan with average detector is necessary. In cases of emission levels between quasi-peak and average limit an additional scan with detector set to average has to be recorded.

Test instruments used:

No.	Type	Model	Serial Number	Manufacturer
01	EMI Receiver	ESHS 10	860043/016	Rohde & Schwarz
02	LISN	ESH3-Z5	862770/021	Rohde & Schwarz
03	LISN	ESH-3-Z5	830952/025	Rohde & Schwarz
04	Shielded Room No. 4	---	3FD-100 544	Euroshield

**7.2. Radiated emission 9 kHz - 30 MHz (§15.205, §15.209 / IC RSS-210 Sections 6.2.1, 6.3)**

Radiated emissions in the frequency range 9 kHz – 30 MHz were measured initially at a distance of 3 meters. A prescan at 3 meter distance were performed in a shielded room with the detector of the spectrum analyzer or EMI Receiver set to peak. Hand-held or body-worn devices are rotated through three orthogonal axes to determine which attitude and configuration produces the highest emission relative to the limit and therefore shall be used for final testing.

Final measurement is then performed at 30 meter distance. In case the regulation requires testing at other distances, the result will be extrapolated. The extrapolation factor is determined by making a second measurement at 10 meter distance. In cases of very low emissions measurements are performed at shorter distances and results are extrapolated to the required distance. The provisions of 15.31 (d) apply.

According to section 15.209 (d) final measurement is performed with the detector set to Quasi Peak except for the frequency bands 9 – 90 kHz and 110 – 490 kHz where average detector is employed.

See figure 1 for the measurement setup.

Test equipment used (see equipment list for details):  
 001, 004, 103, 104, 140, 172

|--|--|

**7.3. Radiated emission 30 MHz - 1 GHz (§15.205, §15.209 / IC RSS-210 Sections 6.2.1, 6.3)**

Radiated emissions were measured over the frequency range from 30 MHz to 1 GHz. For final testing the detector-function of the spectrum analyzer was set to quasi peak

Measurements were made in both the horizontal and vertical planes of polarization. Preliminary scans were taken in a semi or fully anechoic room using a spectrum analyzer with the detector function set to peak and resolution bandwidth set to 100 kHz. All tests were performed at a test-distance of 3 meters. Hand-held or body-worn devices are rotated through three orthogonal axes to determine which attitude and configuration produces the highest emission relative to the limit and therefore shall be used for final testing.

For final testing an open-area test-site was used. During the tests the EUT was rotated all around and the receiving-antenna was raised and lowered from 1 meter to 4 meters to find the maximum levels of emissions. The cables and equipment were placed and moved within the range of position likely to find their maximum emissions.

See figure 2 for the measurement setup.

Test equipment used (see equipment list for details):

001, 003, 004, 012, 014, 015, 018, 102, 106, 113, 141, 142, 143, 144, 171, 172

## 9. Equipment List

To simplify the identification on each page of the test report, each item of test equipment and ancillaries such as cables is identified (numbered) by the test laboratory (version 01/18/2002), below.

### General Test Equipment and Ancillaries

No.	Instrument/Ancillary	Type	Serial Number	Manufacturer
001	Open area test site	EG 1		Senton
002	Shielded room	No. 1	1451	Albatross
003	Fully anechoic room	No. 2	1452	Albatross
004	Semi-anechoic room	No. 3	1453	Siemens
005	Shielded room	No. 4	3FD 100 544	Euroshield
006	Shielded room	No. 5	5468	Ray Proof Division
007	Temperature test chamber	HT4010	07065550	Heraeus
008	Cable	RG214	1309	Senton
009	Cable	200CM_001	1357	Rosenberger
010	Cable	150CM_001	1479	Rosenberger
011	Cable	150CM_002	1480	Rosenberger

 Part 15, Subpart C, Sections 15.209, 15.205  
 Frequency Band ≤ 30 MHz**

Model: MOBY I SLG 40S  
 Type: TAG Reader System  
 Serial No. ---  
 Applicant: Siemens AG, Fürth  
 Test Site: Open Field Test Site (without Ground Plane)  
 Reference distance:  $d_1 = 300$  meters  
 Test distance:  $d_2 = 10$  meters  
 Limit: Limit calculated using the square of an inverse linear distance extrapolation factor of 40 dB/decade  
 Date of Test: 24 October 2003

Frequency [MHz]	Detector	Receiver reading [dBμV]	Correction factor [dB]	Fieldstrength 10 m [dBμV/m]	Limit 10 m [dBμV/m]	Margin to limit [dB]
0.134	AV	23.5	20.0	43.5	84.1	40.6

Note: Because of low emission at carrier frequency level at 300 m test distance is extrapolated from levels at 3 m and 10 m distance.

**Sample calculation of field strength values:**

Field Strength (dBμV/m) = Reading (dBμV) + Correction Factor (dB)  
 + Extrapolation factor (dB)  
 Limit<sub>d2</sub> (dBμV/m) = Limit<sub>d1</sub> (dBμV/m) + 40 \* Log(d<sub>1</sub>/d<sub>2</sub>)

**Field Strength of Emissions according to FCC Rules,  
 Part 15, Subpart C, Sections 15.209, 15.205  
 Frequency Band ≥ 30 MHz**

Model: MOBY I SLG 40S  
 Type: TAG Reader System  
 Serial No. ---  
 Applicant: Siemens AG, Fürth  
 Test Site: Open Field Test Site  
 Distance: 3 meters  
 Date of Test: 24 October 2003

600.100	QP	vertical	14.5	22.4	36.9	46.0	9.1

**Sample calculation of field strength values:**

$$\text{Field Strength (dBµV/m)} = \text{Receiver Reading (dBµV)} + \text{Correction Factor (dB)}$$

**13. Charts taken during testing**

# Conducted Emission Test 150 kHz - 30 MHz according to FCC Part 15 Subpart C

Model:  
**SLG 40 S**

Serial no.:  
--

Applicant:  
**Siemens AG, Fürth**

Test site:  
**Shielded room, cabin no. 2**

Tested on:  
**Linecord EUT  
Plus 24 V**

Date of test:                      Operator:  
**11/04/2003                      T. Eberl**

Test performed:                      File name:  
**automatically**

Mode:  
- TX mode

- Powered from DASM IF Box

- Supply voltage 24 V DC

Detector:  
**Peak / Final Results: QP**

Final results:  
**20 dB Margin                      8 Subranges**

Result:  
**Limit kept**

Project file:  
**51905-30600-8**
