## 2 Equipment under Test (EUT)

Product type:	RF-module	
Model Name:	X1310-ISM	
Manufacturer:	ACD Elektronik GmbH	
Serial number(s):	#2	
FCC ID:	O2F-X1310TC915	
IC:	9137A-X1310TC915	
Application frequency band:	902.000 MHz to 928.000 MHz	
Frequency range <sup>1)</sup> :	903.500 MHz to 926.750 MHz	
Operating frequencies <sup>1)</sup> :	903.500 MHz to 926.750 MHz	
Number of RF-channels <sup>1)</sup> :	32	
Type of modulation <sup>1)</sup> :	GFSK	
Maximum conducted output power:	-8.18 dBm	
Antenna type <sup>1)</sup> :	Dipole antenna “CTA 915/0/WS/SM/H1”	- detachable - gain: 0 dBi
	Swivel dipole antenna “CTA 920/0/WR/SM/W1”	- detachable - gain: 1 dBi
Antenna connectors:	Yes	
Antenna diversity:	<input type="checkbox"/> yes <input checked="" type="checkbox"/> no	
Power supply <sup>1)</sup> :	DC supplied Nominal voltage: 12.0 V DC Minimum voltage: 4.0 V DC Maximum voltage: 15.0 V DC	
Temperature range <sup>1)</sup> :	-30°C to +70°C	

<sup>1)</sup> As declared by manufacturer.

## 2.1 Photo documentation

For photos taken during testing see annex A.  
For photos of the EUT see annex B.  
For internal photos of the EUT see annex C.

## 2.2 Short description of the EUT

RF-module for data transmission within frequency band from 902 MHz to 928 MHz.

During pre-measurements it was investigated which EUT position is the respective worst-case.  
The EUT positions are documented in annex A.

## 2.3 Operation mode

The EUT was set to the measured channels. Further the following adjustments were set:

Tx-mode:      Channel 1      -> 903.500 MHz  
                  Channel 16     -> 914.750 MHz  
                  Channel 32     -> 926.750 MHz  
                  continuous carrier (modulated/unmodulated)

Reference point for all conducted measurements is at plug of antenna connector.

X1310-ISM

## 2.4 Configuration

The following peripheral devices and interface cables were connected during the tests:

Device	Model	Serial or inventory number
RF-module	X1310-ISM	#2
Dipole antenna	CTA 915/0/WS/SM/H1	----
Swivel dipole antenna	CTA 920/0/WR/SM/W1	----
Antenna reference plane	----	----
DC power supply	Statron 3252.1	E00541
DC power supply	Statron 3231.1	E00528
Switching mode power supply <sup>1)</sup>	GPE125-12100-Z	A/1206EA
AC power source 230V/50 Hz to 120V/60 Hz	Chroma 61602	E00633

Note 1): Only used for measurement "AC power line conducted emissions 150 kHz to 30 MHz".

## Used cables

Count:	Description: (type / lengths / remarks)	Serial or inventory number
1	combined DC power and data cable / unshielded / 1.5 m	N/A
1	test cable no. 14 / coax, SMA <-> UFL / 0.2 m	E00437

# 3 AC power line conducted emissions

according to 47 CFR Part 15, section 15.207, and  
RSS-Gen, section 8.8

## 3.1 Test location

Description	Manufacturer	Inventory No.
Shielded room	Siemens - Matsushita	E00107

## 3.2 Test instruments

	Description	Manufacturer	Inventory No.
<input checked="" type="checkbox"/>	ESCS 30	Rohde & Schwarz	E00003
<input type="checkbox"/>	ESU 26	Rohde & Schwarz	W00002
<input type="checkbox"/>	ESCI	Rohde & Schwarz	E00001
<input type="checkbox"/>	ESH3-Z2	Rohde & Schwarz	E00028
<input checked="" type="checkbox"/>	ESH2-Z5	Rohde & Schwarz	E00004
<input type="checkbox"/>	ESH2-Z5	Rohde & Schwarz	E00005

## 3.3 Limits

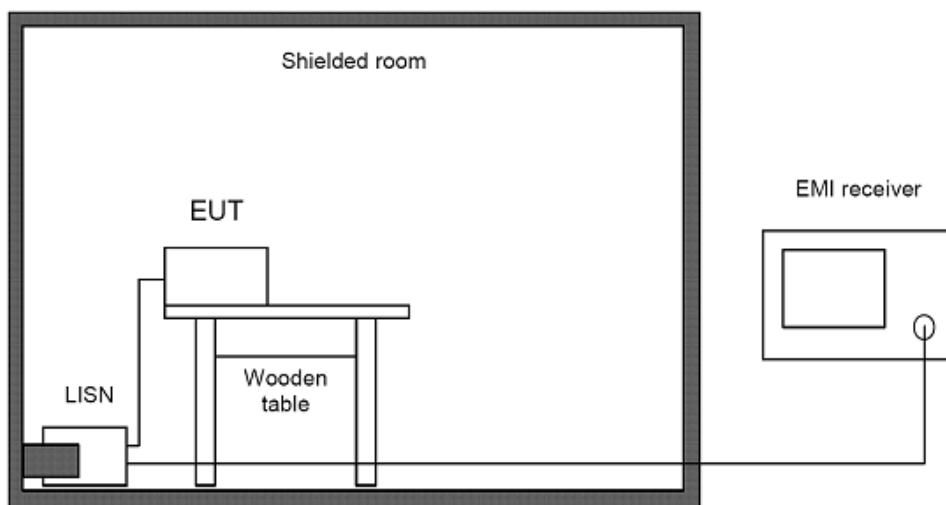

Frequency [MHz]	Quasi-peak [dB $\mu$ V]	Avarage [dB $\mu$ V]
0.15 – 0.5	66 – 56	56 – 46
0.5 – 5.0	56	46
5 – 30	60	50

## 3.4 Test procedure

1. The tests of conducted emission were carried out in a shielded room using a line impedance stabilization network (LISN) 50  $\mu$ H/50 Ohms and an EMI test receiver.
2. The EMI test receiver was connected to the LISN and set to a measurement bandwidth of 9 kHz in the frequency range from 0.15 MHz to 30 MHz.
3. The EUT was placed on a wooden table and connected to the LISN.
4. To accelerate the measurement the detector of the EMI test receiver was set to peak and the whole frequency range from 0.15 MHz to 30 MHz was scanned.
5. After that all peaks values with less margin than 10 dB to quasi-peak limit or exceeding the limit were marked and re-measured with quasi-peak detector.
6. If after that all values are under the average limit no addition measurement is necessary. In case there are still values between quasi-peak and average limit then these values were re-measured with average detector.
7. These measurements were done on all power lines.

## 4.3 Limits

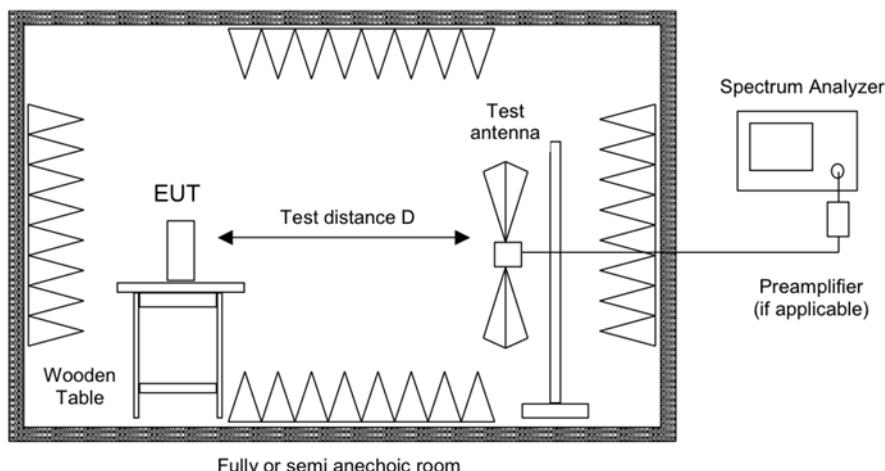

For systems operating within the band 902.0 MHz - 928.0 MHz: 94 dB $\mu$ V/m (50 mV/m)

## 4.4 Test procedure

1. Configure the EUT according to ANSI C63.10. The EUT was placed on the top of the turntable 1.5 meter above ground. The receiving antenna was placed 3 meters from the turntable. The test setup was placed inside a fully anechoic chamber.
2. Power on the EUT and all peripherals.
3. Set frequency to lowest channel
4. Maximize carrier by moving turntable and antenna height with horizontal and vertical antenna polarization. Perform test for all of the 3 orthogonal positions.
5. Record this trace(s) and set appropriate markers
6. Set frequency to middle channel
7. Repeat steps 4 and 5
8. Set frequency to highest channel
9. Repeat steps 4 and 5

## 4.5 Test setup

Picture 6: Test setup for transmitter radiated field strength measurement

## 4.6 Test deviation

There is no deviation with the original standard.

## 4.7 EUT operation during Test

The EUT was programmed to be in continuously transmitting mode.

## 4.8 Test results CTA 915/0/WS/SM/H1

Temperature:	20°C	Humidity:	43%
Tested by:	A. Grill	Test date:	2016-09-06

$f_{\text{meas}}$ [MHz]	EUT-Pos	Ant.-Pol.	$E_{\text{meas}}$ [dB $\mu$ V/m]	Detector	Limit [dB $\mu$ V/m]	Result

## 5.3 Limits

Emissions radiated outside of the specified frequency bands, except for harmonics, shall be attenuated by at least 50 dB below the level of the fundamental or to the general radiated emission limits in §15.209, whichever is the lesser attenuation.

Limit for field strength of harmonics is 54 dB $\mu$ V/m (500  $\mu$ V/m).

In case of emission falling into restricted bands specified on 15.205(a), limit according to 15.209(a) in table below applies. For emissions above 1 GHz the limits are:

54 dB $\mu$ V/m (video average)

74 dB $\mu$ V/m (peak detector)

## 5.4 Test procedure

1. Configure the EUT according to ANSI C63.10. The EUT was placed on the top of the turntable 1.5 meter above ground. The receiving antenna was placed 3 meters from the turntable. The test setup was placed inside a fully anechoic chamber.
2. Power on the EUT and all peripherals.
3. Set frequency to lowest channel
4. Maximize radiated emission at band edges by moving turntable and antenna height with horizontal and vertical antenna polarization.
5. Record this trace(s) and set appropriate markers
6. Set frequency to highest channel

## 6.4 Limits

Emissions radiated outside of the specified frequency bands, except for harmonics, shall be attenuated by at least 50 dB below the level of the fundamental or to the general radiated emission limits in §15.209, whichever is the lesser attenuation.

Limit for field strength of harmonics is 54 dB $\mu$ V/m (500  $\mu$ V/m).

In case of emission falling into restricted bands specified on 15.205(a), limit according to 15.209(a) in table below applies.

Frequency [MHz]	Field strength Fs [ $\mu$ V/m]	Field strength [dB $\mu$ V/m]	Measurement distance d [m]
0.009 – 0.490	266.6 – 4.9	48.5 – 13.8	300
0.490 – 1.705	48.98 – 14.08	33.8 – 22.97	30
1.705 – 30.0	30	29.54	30
30 – 88	100	40	3
88 – 216	150	43.5	3
216 - 960	200	46	3
Above 960	500	54	3

## 6.5 Test procedure

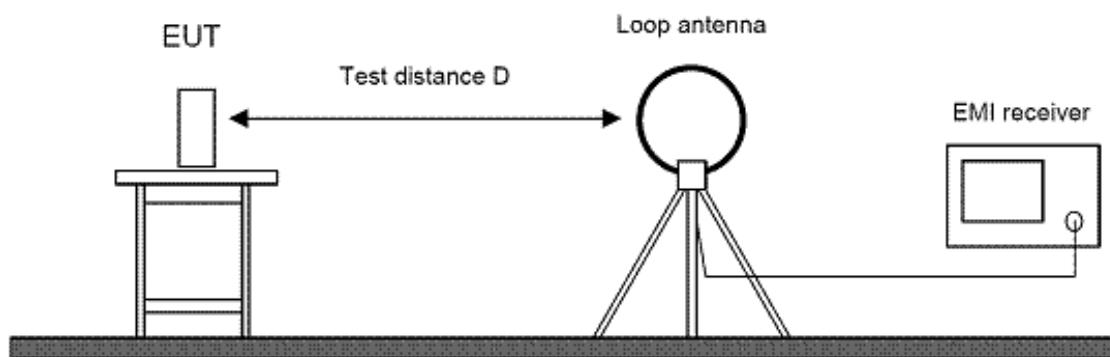

1. Configure the EUT according to ANSI C63.10. The EUT is placed on the top of the turntable 0.8 meter above ground. The receiving antenna is placed 3 meters from the turntable. For prescan measurements the test setup is placed inside a compact diagnostic chamber.
2. Power on the EUT and all peripherals.
3. The broadband antenna is set to vertical polarization.
4. The EMI receiver performs a scan from 9 kHz to 30 MHz or 30MHz to 1000MHz with the detector set to peak. Appropriate CISPR measurement bandwidths are used, i. e. 200 Hz for the frequency range 9 kHz to 150 kHz, 10 kHz for 150 kHz to 30 MHz and 120 kHz for 30MHz to 1000MHz.
5. The turn table is rotated to 6 different positions ( $360^\circ / 6$ ) and the antenna polarization is changed to horizontal.
6. Repeat the test procedure at step 4 and 5.
7. Then the test setup is placed in an OATS at 3 m distance and all peak values over or with less than 6dB margin to the limit are re-measured with quasi-peak detector (except for the frequency bands 9–90 kHz and 110–490 kHz where average detector is used). If the margin of all emissions recorded prescan in the compact diagnostic chamber is more than 6 dB no final test in OATS is performed.
8. The turntable is rotated by 360 degrees to determine the position of the highest radiation.
9. The height of the broadband receiving antenna is varied between one meter and four meters above ground to find the maximum emissions field strength of both horizontal and vertical polarization. The highest value is recorded.
10. For emissions below 30MHz, measurements are performed with a loop antenna. The antenna height is not changed during this test.

## 7.4 Test procedure

1. Configure the EUT according to ANSI C63.10. The EUT was placed on the top of the turntable 1.5 meter above ground. The receiving antenna was placed 3 meters from the turntable. The test setup was placed inside a fully anechoic chamber.
2. Power on the EUT and all peripherals.
3. The broadband antenna was set to vertical polarization.
4. The EMI receiver performed a scan from 1000 MHz to 10<sup>th</sup> harmonic of the fundamental frequency with the detector set to peak and the measurement bandwidth set to 1 MHz (VBW ≥ 3 MHz). The trace data was recorded with the receiver Max Hold function.
5. The turn table was rotated in intervals of 15°.
6. After a full 360°-turn the antenna polarization was changed to horizontal and the test was repeated at step 4 and 5.
7. After the scan suspicious frequencies were selected and maximized by moving turntable and variation of antenna height until maximum of emission was found.
8. Then the RBW was set to 1 MHz and the VBW was reduced to a minimum of 10 Hz (1 kHz by default) to get average values determined by video averaging.
9. The receiving antenna was set to vertical polarization.
10. The turntable was rotated by 360 degrees to determine the position of the highest radiation.
11. The receiving antenna was then set to horizontal polarization and the measurement was repeated at step 9.
12. The highest recorded level was noted.

## 7.5 Test setup

Picture 36: Test setup for radiated emission measurement (> 1 GHz)

## 7.6 Test deviation

There is no deviation with the original standard.

## 7.7 EUT operation during test

The EUT was programmed to be in continuously transmitting mode.

For these measurements it was investigated that EUT-position1 is the respective worst-case.

20 dB bandwidth must be contained within the designated frequency band.

## 9.4 Test procedure

1. The transmitter output (antenna port) was connected to the spectrum analyzer in peak hold mode.
2. The unit was operated in continuous transmit mode with modulation.
3. The resolution bandwidth was set to equal or greater than 1.0% of the emission bandwidth with video bandwidth at least equal to resolution bandwidth.
4. The maximum width of the emission that is constrained by the frequencies associated with the two outermost amplitude points (upper and lower frequencies) that are attenuated by 20 dB relative to the maximum level measured in the fundamental emission were recorded.

## 9.5 Test setup

Picture 47: Test setup for 20 dB bandwidth measurement

## 9.6 Test deviation

There is no deviation with the original standard.

## 9.7 EUT operation during test

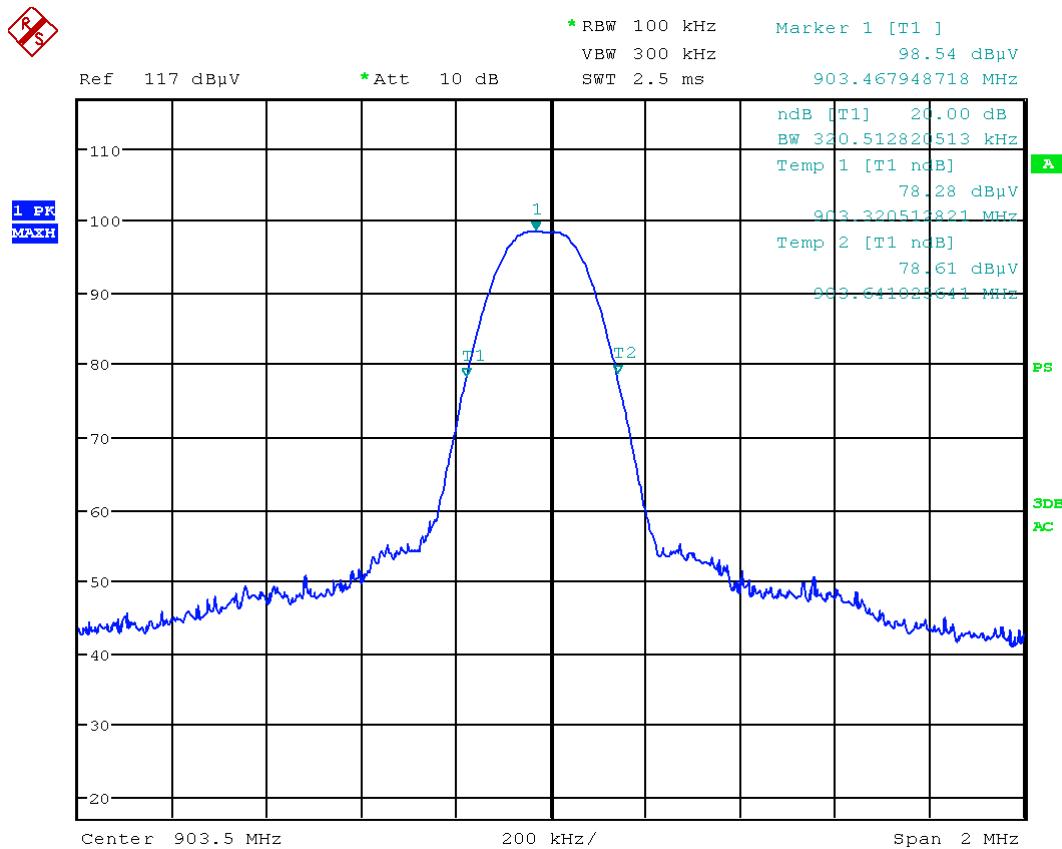

The EUT was programmed to be in continuously transmitting mode.

## 9.8 Test results

Temperature:	19°C	Humidity:	44%
Tested by:	M. Müller	Test date:	2016-10-04

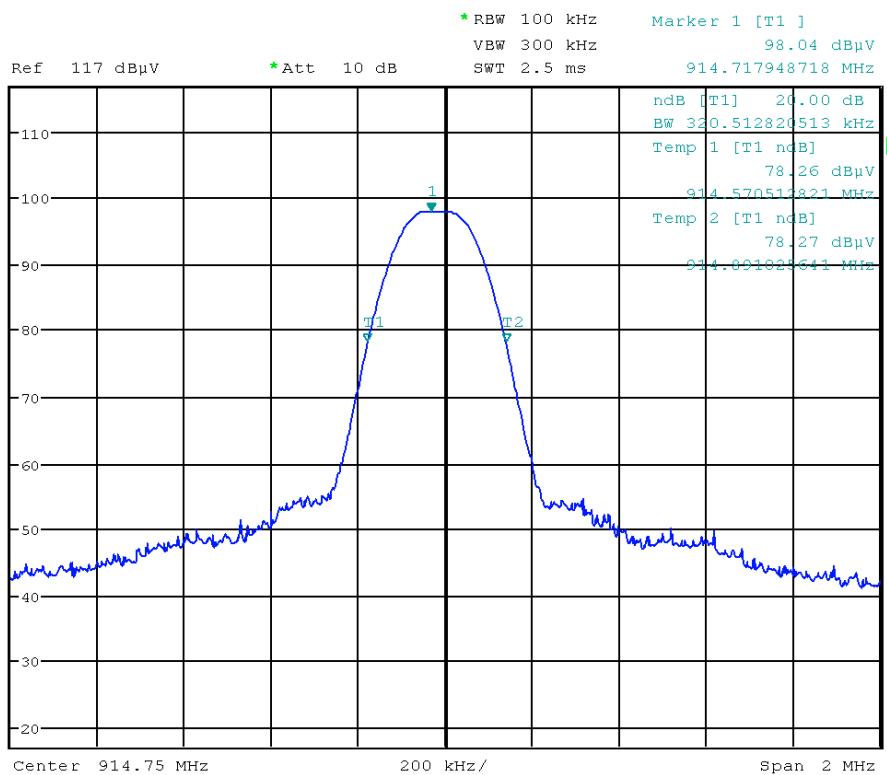

Designated frequency band: 902.000 MHz to 928.000 MHz

Channel	Frequency (MHz)			20 dB bandwidth (kHz)	Result
	peak	low	high		
1	903.468	903.321	903.641	320.513	within band
16	914.718	914.571	914.891	320.513	within band
32	926.718	926.567	926.891	323.718	within band

# 10 Occupied bandwidth

according to 47 CFR Part 2, section 2.202(a) and  
RSS-Gen Issue 4, section 6.6

## 10.1 Test location

- Conducted measurement
- Scan with peak detector in 3 m CDC
- CISPR measurement with quasi peak detector on 10m open area test site.
- Measurement with peak detector on 3m open area test site

Description	Manufacturer	Inventory No.
CDC	Albatross Projects	E00026
Open area test site	EMV <b>TESTHAUS</b> GmbH	E00354

## 10.2 Test Instruments

	Description	Manufacturer	Inventory No.
<input type="checkbox"/>	ESCS 30 (FF)	Rohde & Schwarz	E00003
<input checked="" type="checkbox"/>	ESU 26	Rohde & Schwarz	W00002
<input type="checkbox"/>	ESCI (CDC)	Rohde & Schwarz	E00001
<input type="checkbox"/>	HFH2-Z2	Rohde & Schwarz	E00060
<input type="checkbox"/>	VULB 9163 (FF)	Schwarzbeck	E00013
<input type="checkbox"/>	VULB 9160 (CDC)	Schwarzbeck	E00011

## 10.3 Limits

As not specified in the specific rule section the occupied bandwidth is measured and reported for information only.

## 10.4 Test procedure

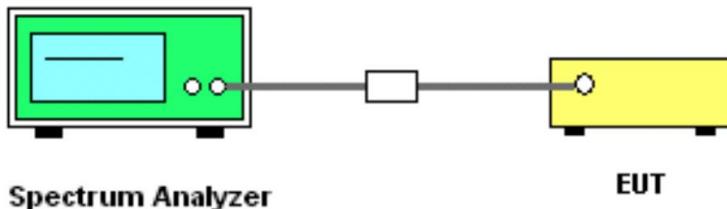

1. The test is performed in accordance with 47 CFR Part 2, section 2.202(a)
2. The transmitter output (antenna port) was connected to the spectrum analyzer in peak hold mode.
3. The unit was operated in continuous transmit mode with modulation.
4. The resolution bandwidth (RBW) shall be in the range of 1% to 5% of the occupied bandwidth (OBW) and video bandwidth (VBW) shall be approximately three times the RBW.
5. The 99 % frequency bandwidth was measured so that, below its lower and above its upper frequency limits, the mean powers radiated were each equal to 0.5 percent of the total mean power radiated by a given emission.

## 11.1 Data of equipment under test (EUT)

Antenna connector (see clause 2):	<input checked="" type="checkbox"/> permanent <input type="checkbox"/> none	<input type="checkbox"/> temporary
Antenna detachable:	<input checked="" type="checkbox"/> yes	<input type="checkbox"/> no
Tune-up function:	<input type="checkbox"/> yes	<input checked="" type="checkbox"/> no
Maximum antenna gain (see clause 2):	logarithmic 1.0 dBi	numeric 1.26
Maximum conducted output power (see clause 2):	logarithmic -8.18 dBm	numeric 0.15 mW
Maximum equivalent isotropically radiated power:	logarithmic -7.18 dBm	numeric 0.19 mW
Maximum operation frequency (see clause 2):	926.750 MHz	
Minimum test separation distance:	5 mm	

## 11.2 Requirements

To be excluded from SAR tests set out in 47 CFR Part 2, §2.1093, the limits of the general guidelines for RF Exposure as described in KDB 447498 D01, section 4.3.1, have to be kept. For 100 MHz to 6 GHz and test separation distances  $\leq 50$  mm, the 1 g and 10 g SAR test exclusion thresholds are determined by the following equation:

$$\frac{P_{conducted}(mW) \cdot \sqrt{f(GHz)}}{d_{min}(mm)} \leq 3.0$$

with:  $P_{conducted}$  = source-based time-averaged maximum conducted output power in mW, adjusted for tune-up tolerance  
 $f$  = RF channel transmit frequency in GHz  
 $d_{min}$  = minimum test separation distance in mm determined by the smallest distance from the antenna and radiating structures or outer surface of the device, according to the host form factor, exposure conditions and platform requirements, to any part of the body or extremity of a user or bystander

According to RSS-102, section 2.5.1, SAR evaluation is required if the separation distance between the user and/or bystander and the antenna and/or radiating element of the device is less than or equal to 20 cm, except when the device operates at or below the applicable output power level (adjusted for tune-up tolerance) for the specified separation distance defined in table 1 of RSS-102 (see table 1). Output power level shall be the higher of the maximum conducted or equivalent isotropically radiated power (e.i.r.p.) source-based, time-averaged output power.

Frequency (MHz)	Exemption Limits (mW)				
	At separation distance of ≤5 mm	At separation distance of 10 mm	At separation distance of 15 mm	At separation distance of 20 mm	At separation distance of 25 mm
≤300	71 mW	101 mW	132 mW	162 mW	193 mW
450	52 mW	70 mW	88 mW	106 mW	123 mW
835	17 mW	30 mW	42 mW	55 mW	67 mW
1900	7 mW	10 mW	18 mW	34 mW	60 mW
2450	4 mW	7 mW	15 mW	30 mW	52 mW
3500	2 mW	6 mW	16 mW	32 mW	55 mW
5800	1 mW	6 mW	15 mW	27 mW	41 mW

Frequency (MHz)	Exemption Limits (mW)				
	At separation distance of 30 mm	At separation distance of 35 mm	At separation distance of 40 mm	At separation distance of 45 mm	At separation distance of ≥50 mm
≤300	223 mW	254 mW	284 mW	315 mW	345 mW
450	141 mW	159 mW	177 mW	195 mW	213 mW
835	80 mW	92 mW	105 mW	117 mW	130 mW
1900	99 mW	153 mW	225 mW	316 mW	431 mW
2450	83 mW	123 mW	173 mW	235 mW	309 mW
3500	86 mW	124 mW	170 mW	225 mW	290 mW
5800	56 mW	71 mW	85 mW	97 mW	106 mW

Table 1: Limits for exemption from SAR evaluation

## 11.3 Results

### 11.3.1 Test results according to KDB 447498 D01

$$\frac{P_{conducted}(mW) \cdot \sqrt{f(GHz)}}{d_{min}(mm)} \leq 3.0 \Leftrightarrow \frac{1 \cdot \sqrt{0.92675}}{5} \leq 3.0 \\ \Leftrightarrow 0.2 \leq 3.0 \quad \checkmark$$

Notes:

- 1 Power and distance are rounded to the nearest mW and mm before calculation.
- 2 The result is rounded to one decimal place for comparison

### 11.3.2 Test results according to RSS-102

Calculation of exemption limit at maximum operation frequency using linear interpolation for the applicable separation distance:

$$P_{limit}(f) = P_{limit}(f_n) + \frac{f - f_n}{f_{n+1} - f_n} \cdot (P_{limit}(f_{n+1}) - P_{limit}(f_n))$$

- with:
- |                      |                                                                                             |
|----------------------|---------------------------------------------------------------------------------------------|
| $P_{limit}(f)$       | = exemption limit at maximum operation frequency                                            |
| $P_{limit}(f_n)$     | = exemption limit at lower frequency listed in table closest to maximum operation frequency |
| $P_{limit}(f_{n+1})$ | = exemption limit at upper frequency listed in table closest to maximum operation frequency |
| $F$                  | = maximum operation frequency                                                               |
| $f_n$                | = lower frequency listed in table closest to maximum operation frequency                    |
| $f_{n+1}$            | = upper frequency listed in table closest to maximum operation frequency                    |

$$P_{limit}(926.750 \text{ MHz}) = 17 \text{ mW} + \frac{926.750 \text{ MHz} - 835 \text{ MHz}}{1900 \text{ MHz} - 835 \text{ MHz}} \cdot (7 \text{ mW} - 17 \text{ mW})$$

$$P_{limit}(926.750 \text{ MHz}) = 16.14 \text{ mW}$$

As the maximum output power is defined as the higher level of the maximum conducted or equivalent isotropically radiated power (e.i.r.p.) it results in 0.19 mW which is below the exemption limit at maximum operation frequency.

## 12 Equipment calibration status

# 13 Measurement uncertainty

Description	Max. deviation	k=
Conducted emission AMN (9kHz to 30 MHz)	± 4.0 dB	2
Radiated emission open field (30 MHz to 1 GHz)	± 4.5 dB	2
Radiated emission absorber chamber <td>± 5.4 dB</td> <td>2</td>	± 5.4 dB	2

Table 3: Measurement uncertainty

Comment: The uncertainty stated is the expanded uncertainty obtained by multiplying the standard uncertainty by the coverage factor k. If k=2 the value of the measurements lies within the assigned range of values with a probability of 95 %.

## 14 Summary

The EMC Regulations according to the marked specifications are

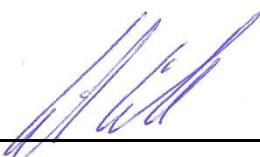

**KEPT**

The EUT does fulfill the general approval requirements mentioned.

**NOT KEPT**

The EUT does not fulfill the general approval requirements mentioned.
