

### AirSynergy Tune-up procedure

Each Airsynergy is subject to an automated RF Calibration” as part of system test during manufacture. As part of the test, the RF output power level is measured at a number of nominal power level settings. At each level the gain setting is altered as required so that actual transmitted power is the same as the set power level. The gain settings required to do this are unique to each unit and recorded and loaded on the unit as part of the automated system test.
