## INTRODUCTION

This document contains a summary of the requirements set forth by the IEEE 1528 , FCC KDBs and CEI/IEC 62209 standards for reference dipoles used for SAR measurement system validations and the measurements that were performed to verify that the product complies with the fore mentioned standards.

| Product Condition (new / used) | Used |

## 3 PRODUCT DESCRIPTION

### 3.1 GENERAL INFORMATION

MVG's COMOSAR Validation Dipoles are built in accordance to the IEEE 1528, FCC KDBs and CEI/IEC 62209 standards. The product is designed for use with the COMOSAR test bench only.

Figure 1 - MVG COMOSAR Validation Dipole

## 4 MEASUREMENT METHOD

The IEEE 1528 , FCC KDB s and CEI/IEC 62209 standards provide requirements for reference dipoles used for system validation measurements. The following measurements were performed to verify that the product complies with the fore mentioned standards.

### 4.1 RETURN LOSS REQUIREMENTS

The dipole used for SAR system validation measurements and checks must have a return loss of -20 dB or better. The return loss measurement shall be performed against a liquid filled flat phantom, with the phantom constructed as outlined in the fore mentioned standards. A direct method is used with a network analyser and its calibration kit, both with a valid ISO17025 calibration.

### 4.2 MECHANICAL REQUIREMENTS

The IEEE Std. 1528 and CEI/IEC 62209 standards specify the mechanical components and dimensions of the validation dipoles, with the dimension's frequency and phantom shell thickness dependent. The COMOSAR test bench employs a 2 mm phantom shell thickness therefore the dipoles sold for use with the COMOSAR test bench comply with the requirements set forth for a 2 mm phantom shell thickness. A direct method is used with a ISO17025 calibrated caliper.

## 5 MEASUREMENT UNCERTAINTY

All uncertainties listed below represent an expanded uncertainty expressed at approximately the $95 \%$ confidence level using a coverage factor of $\mathrm{k}=2$, traceable to the Internationally Accepted Guides to Measurement Uncertainty.

### 5.1 RETURN LOSS

The following uncertainties apply to the return loss measurement:

| Frequency band | Expanded Uncertainty on Return Loss |
| :---: | :---: |
| $400-6000 \mathrm{MHz}$ | 0.08 LIN |

### 5.2 DIMENSION MEASUREMENT

The following uncertainties apply to the dimension measurements:

| Length (mm) | Expanded Uncertainty on Length |
| :---: | :---: |
| $0-300$ | 0.20 mm |
| $300-450$ | 0.44 mm |

### 5.3 VALIDATION MEASUREMENT

The guidelines outlined in the IEEE 1528, FCC KDBs, CENELEC EN50361 and CEI/IEC 62209 standards were followed to generate the measurement uncertainty for validation measurements.

| Scan Volume | Expanded Uncertainty |

## 7 VALIDATION MEASUREMENT

The IEEE Std. 1528, FCC KDBs and CEI/IEC 62209 standards state that the system validation measurements must be performed using a reference dipole meeting the fore mentioned return loss and mechanical dimension requirements. The validation measurement must be performed against a liquid filled flat phantom, with the phantom constructed as outlined in the fore mentioned standards. Per the standards, the dipole shall be positioned below the bottom of the phantom, with the dipole length centered and parallel to the longest dimension of the flat phantom, with the top surface of the dipole at the described distance from the bottom surface of the phantom.

| 2450 | $39.2 \pm 10 \%$ | 41.9 | $1.80 \pm 10 \%$ | 1.88 |
| 2600 | $39.0 \pm 10 \%$ |  | $1.96 \pm 10 \%$ |  |
| 3000 | $38.5 \pm 10 \%$ |  | $2.40 \pm 10 \%$ |  |
| 3500 | $37.9 \pm 10 \%$ |  | $2.91 \pm 10 \%$ |  |

### 7.3 MEASUREMENT RESULT

The IEEE Std. 1528 and CEI/IEC 62209 standards state that the system validation measurements should produce the SAR values shown below (for phantom thickness of 2 mm ), within the uncertainty for the system validation. All SAR values are normalized to 1 W forward power. In bracket, the measured SAR is given with the used input power.

| $\begin{gathered} \text { Frequency } \\ \mathrm{MHz} \\ \hline \end{gathered}$ | $1 \mathrm{~g} \mathrm{SAR}(\mathrm{W} / \mathrm{kg} / \mathrm{W})$ |  | 10 g SAR (W/kg/W) |  |
| :---: | :---: | :---: | :---: | :---: |
|  | required | measured | required | measured |
| 300 | 2.85 |  | 1.94 |  |
| 450 | 4.58 |  | 3.06 |  |
| 750 | 8.49 |  | 5.55 |  |
| 835 | 9.56 |  | 6.22 |  |

## 1 <br> INTRODUCTION

This document contains a summary of the requirements set forth by the IEEE 1528 , FCC KDBs and CEI/IEC 62209 standards for reference dipoles used for SAR measurement system validations and the measurements that were performed to verify that the product complies with the fore mentioned standards.

| Device Under Test |  |

| Model | SID2600 |
| Serial Number | SN 03/15 DIP2G600-356 |
| Product Condition (new / used) | Used |

3
PRODUCT DESCRIPTION

### 3.1 GENERAL INFORMATION

MVG's COMOSAR Validation Dipoles are built in accordance to the IEEE 1528, FCC KDBs and CEI/IEC 62209 standards. The product is designed for use with the COMOSAR test bench only.

Figure 1 -MVG COMOSAR Validation Dipole

## 4 MEASUREMENT METHOD

The IEEE 1528 , FCC KDBs and $\mathrm{CEI} / \mathrm{IEC} 62209$ standards provide requirements for reference dipoles used for system validation measurements. The following measurements were performed to verify that the product complies with the fore mentioned standards.

### 4.1 RETURN LOSS REQUIREMENTS

The dipole used for SAR system validation measurements and checks must have a return loss of -20 dB or better. The return loss measurement shall be performed against a liquid filled flat phantom, with the phantom constructed as outlined in the fore mentioned standards. A direct method is used with a network analyser and its calibration kit, both with a valid ISO17025 calibration.

### 4.2 MECHANICAL REQUIREMENTS

The IEEE Std. 1528 and CEI/IEC 62209 standards specify the mechanical components and dimensions of the validation dipoles, with the dimension's frequency and phantom shell thickness dependent. The COMOSAR test bench employs a 2 mm phantom shell thickness therefore the dipoles sold for use with the COMOSAR test bench comply with the requirements set forth for a 2 mm phantom shell thickness. A direct method is used with a ISO17025 calibrated caliper.

## 5 MEASUREMENT UNCERTAINTY

All uncertainties listed below represent an expanded uncertainty expressed at approximately the $95 \%$ confidence level using a coverage factor of $\mathrm{k}=2$, traceable to the Internationally Accepted Guides to Measurement Uncertainty.

### 5.1 RETURN LOSS

The following uncertainties apply to the return loss measurement:

| Frequency band | Expanded Uncertainty on Return Loss |
| :---: | :---: |
| $400-6000 \mathrm{MHz}$ | 0.08 LIN |

### 5.2 DIMENSION MEASUREMENT

The following uncertainties apply to the dimension measurements:

| Length (mm) | Expanded Uncertainty on Length |
| :---: | :---: |
| $0-300$ | 0.20 mm |
| $300-450$ | 0.44 mm |

### 5.3 VALIDATION MEASUREMENT

The guidelines outlined in the IEEE 1528, FCC KDBs, CENELEC EN50361 and CEI/IEC 62209 standards were followed to generate the measurement uncertainty for validation measurements.

## 7 VALIDATION MEASUREMENT

The IEEE Std. $1528, \mathrm{FCC} \mathrm{KDBs}$ and CEI/IEC 62209 standards state that the system validation measurements must be performed using a reference dipole meeting the fore mentioned return loss and mechanical dimension requirements. The validation measurement must be performed against a liquid filled flat phantom, with the phantom constructed as outlined in the fore mentioned standards. Per the standards, the dipole shall be positioned below the bottom of the phantom, with the dipole length centered and parallel to the longest dimension of the flat phantom, with the top surface of the dipole at the described distance from the bottom surface of the phantom.
7.1 MEASUREMENT CONDITION

| Software | OPENSAR V5 |

## 1 INTRODUCTION

This document contains a summary of the requirements set forth by the IEEE 1528 and CEI／IEC 62209 standards for reference waveguides used for SAR measurement system validations and the measurements that were performed to verify that the product complies with the fore mentioned standards．

2

3
PRODUCT DESCRIPTION

## 3．1 GENERAL INFORMATION

MVG＇s COMOSAR Validation Waveguides are built in accordance to the IEEE 1528 and CEI／IEC 62209 standards．

## 4 MEASUREMENT METHOD

The IEEE 1528 and CEI／IEC 62209 standards provide requirements for reference waveguides used for system validation measurements．The following measurements were performed to verify that the product complies with the fore mentioned standards．

## 4．1 RETURN LOSS REQUIREMENTS

The waveguide used for SAR system validation measurements and checks must have a return loss of -8 dB or better．The return loss measurement shall be performed with matching layer placed in the open end of the waveguide，with the waveguide and matching layer in direct contact with the phantom shell as outlined in the fore mentioned standards．A direct method is used with a network analyser and its calibration kit，both with a valid ISO17025 calibration．

## 4．2 MECHANICAL REQUIREMENTS

The IEEE 1528 and CEI／IEC 62209 standards specify the mechanical dimensions of the validation waveguide，the specified dimensions are as shown in Section 6．2．Figure 1 shows how the dimensions relate to the physical construction of the waveguide．A direct method is used with a ISO17025 calibrated caliper．

## 5

## MEASUREMENT UNCERTAINTY

All uncertainties listed below represent an expanded uncertainty expressed at approximately the $95 \%$ confidence level using a coverage factor of $\mathrm{k}=2$, traceable to the Internationally Accepted Guides to Measurement Uncertainty.

### 5.1 RETURN LOSS

The following uncertainties apply to the return loss measurement:

| Frequency band | Expanded Uncertainty on Return Loss |
| :---: | :---: |
| $400-6000 \mathrm{MHz}$ | 0.08 LIN |

### 5.2 DIMENSION MEASUREMENT

The following uncertainties apply to the dimension measurements:

| Length (mm) | Expanded Uncertainty on Length |
| :---: | :---: |
| $0-300$ | 0.20 mm |

### 5.3 VALIDATION MEASUREMENT

The guidelines outlined in the IEEE 1528 and CEI/IEC 62209 standards were followed to generate the measurement uncertainty for validation measurements.

| Scan Volume | Expanded Uncertainty |
| :---: | :---: |
| 1 g | $19 \%(\mathrm{SAR})$ |
| 10 g | $19 \%(\mathrm{SAR})$ |

## 7 VALIDATION MEASUREMENT

The IEEE Std. 1528 and CEI/IEC 62209 standards state that the system validation measurements must be performed using a reference waveguide meeting the fore mentioned return loss and mechanical dimension requirements. The validation measurement must be performed with the matching layer placed in the open end of the waveguide, with the waveguide and matching layer in direct contact with the phantom shell.

## <Justification of the extended calibration>

If dipoles are verified in return loss ( $<-20 \mathrm{~dB}$, within $20 \%$ of prior calibration for below 3 GHz , and $<-8 \mathrm{~dB}$, within $20 \%$ of prior calibration for 5 GHz to 6 GHz ), and in impedance (within 5 ohm of prior calibration), the annual calibration is not necessary and the calibration interval can be extended.
<Head 750MHz>

| Return Loss (dB) | Delta (\%) | Impedance | Delta(ohm) | Date of Measurement |
| :---: | :---: | :---: | :---: | :---: |
| -23.80 | - | 56.4 | - | Mar. 01, 2021 |
| -23.642 | 0.66 | 56.998 | 0.598 | Feb. 28, 2022 |

The return loss is $<-20 \mathrm{~dB}$, within $20 \%$ of prior calibration; the impedance is within 5 ohm of prior calibration. Therefore the verification result should support extended calibration.

＜Head 835MHz＞

| Return Loss（dB） | Delta（\％） | Impedance | Delta（ohm） | Date of Measurement |
| :---: | :---: | :---: | :---: | :---: |
| -25.44 | - | 54.40 | - | Mar．01，2021 |
| -25.803 | 1.43 | 54.492 | 0.092 | Feb．28，2022 |

The return loss is $<-20 \mathrm{~dB}$ ，within $20 \%$ of prior calibration；the impedance is within 5 ohm of prior calibration．Therefore the verification result should support extended calibration．

＜Head 1800MHz＞

| Return Loss（dB） | Delta（\％） | Impedance | Delta（ohm） | Date of Measurement |
| :---: | :---: | :---: | :---: | :---: |
| -28.85 | - | 47.90 | - | Mar．01，2021 |
| -28.545 | 1.06 | 47.809 | 0.091 | Feb．28，2022 |

The return loss is $<-20 \mathrm{~dB}$ ，within $20 \%$ of prior calibration；the impedance is within 5 ohm of prior calibration．Therefore the verification result should support extended calibration．

Dipole Verification Data

<Head 1900MHz>

| Return Loss (dB) | Delta (\%) | Impedance | Delta(ohm) | Date of Measurement |
| :---: | :---: | :---: | :---: | :---: |
| -24.79 | - | 50.80 | - | Mar. 01, 2021 |
| -24.518 | 1.10 | 50.516 | 0.284 | Feb. 28, 2022 |

The return loss is $<-20 \mathrm{~dB}$, within $20 \%$ of prior calibration; the impedance is within 5 ohm of prior calibration. Therefore the verification result should support extended calibration.

＜Head 2450MHz＞

| Return Loss（dB） | Delta（\％） | Impedance | Delta（ohm） | Date of Measurement |
| :---: | :---: | :---: | :---: | :---: |
| -23.18 | - | 56.30 | - | Mar．01，2021 |
| -23.39 | 0.91 | 56.342 | 0.042 | Feb．28，2022 |

The return loss is $<-20 \mathrm{~dB}$ ，within $20 \%$ of prior calibration；the impedance is within 5 ohm of prior calibration．Therefore the verification result should support extended calibration．

<Head 2600MHz>

| Return Loss (dB) | Delta (\%) | Impedance | Delta(ohm) | Date of Measurement |
| :---: | :---: | :---: | :---: | :---: |
| -21.15 | - | 52.70 | - | Mar. 01, 2021 |
| -21.248 | 0.46 | 53.053 | 0.353 | Feb. 28, 2022 |

The return loss is $<-20 \mathrm{~dB}$, within $20 \%$ of prior calibration; the impedance is within 5 ohm of prior calibration. Therefore the verification result should support extended calibration.

Dipole Verification Data

(8)
<Head 5200MHz>

| Return Loss (dB) | Delta (\%) | Impedance | Delta(ohm) | Date of Measurement |
| :---: | :---: | :---: | :---: | :---: |
| -9.15 | - | 21.17 | - | Mar. 01, 2021 |
| -9.1819 | 0.35 | 21.191 | 0.021 | Feb. 28, 2022 |

The return loss is $<-8 \mathrm{~dB}$, within $20 \%$ of prior calibration; the impedance is within 5 ohm of prior calibration. Therefore the verification result should support extended calibration.

Dipole Verification Data

<Head 5800MHz>

| Return Loss (dB) | Delta (\%) | Impedance | Delta(ohm) | Date of Measurement |
| :---: | :---: | :---: | :---: | :---: |
| -14.30 | - | 54.74 | - | Mar. 01, 2021 |
| -14.349 | 0.34 | 55.115 | 0.375 | Feb. 28, 2022 |

The return loss is $<-8 \mathrm{~dB}$, within $20 \%$ of prior calibration; the impedance is within 5 ohm of prior calibration. Therefore the verification result should support extended calibration.
