

Engineering and Testing for EMC and Safety Compliance

CERTIFICATION APPLICATION REPORT
FCC PART 24

Test Lab: Rhein Tech Laboratories, Inc. Phone: 703-689-0368 360 Herndon Parkway Fax: 703-689-2056 Suite 1400 Web Site: www.rheintech.com Herndon, VA 20170 Contact: ATCBINFO@rheintech.com		Applicant: UTStarcom, Inc. Phone: 732-516-7524 33 Wood Avenue South Fax: 732-767-5283 3 rd Floor Iselin, NJ 08830 USA Contact: Tom Borrelli (borrelli@utstar.com)	
FCC ID:	O6YUTS-FSU811	GRANTEE FRN NUMBER:	0005823877
PLAT FORM:	Transmitter	RTL WORK ORDER NUMBER:	2004005
MODEL:	UTS-FSU811	RTL QUOTE NUMBER:	QRTL04-026
DATE OF TEST REPORT:	March 10, 2004		
American National Standard Institute:	ANSI/TIA-603-B-2002		
FCC Classification:	PCB – Licensed Base Station for Part 24		
FCC Rule Part(s):	Part 24: Personal Communications Services Subpart E – Broadband PCS		
Digital Interface Information	Digital Interface was found to be compliant		
Receiver Information	Receiver was found to be compliant		
Frequency Range (MHz)	Power (W)	Frequency Tolerance	Emission Designator
1880.15-1909.85	0.060	1.7 ppm	263KDXW

I, the undersigned, hereby declare that the equipment tested and referenced in this report conforms to the identified standard(s) as described in this test report. Modifications were made to the equipment during testing in order to achieve compliance with these standards; please see section 2.3 for details.

Furthermore, there was no deviation from, additions to, or exclusions from, the FCC Part 2, FCC Part 15, FCC Part 24, ANSI C63.4 and ANSI/TIA-603-B-2002.

Signature: 

Date: March 10, 2004

Typed/Printed Name: Desmond Fraser

Position: President

Report #: 2004005 Rev 0.02

Note: This report may not be used by the client to claim product endorsement by NVLAP or any agency of the U.S. Government.

This report may not be reproduced, except in full, without the written approval of Rhein Tech Laboratories, Inc.

1 GENERAL INFORMATION

1.1 SCOPE

FCC Rules Part 24 (E) Personal Communications Services – Broadband PCS

All measurements contained in this application were conducted in accordance with the FCC Rules and Regulations CFR47 and ANSI/TIA-603-B-2002 Land Mobile FM or PM Communications Equipment Measurement and Performance Standards. The instrumentation utilized for the measurements conforms to the ANSI C63.4 standard for EMI and Field Strength Instrumentation. Calibration checks are performed regularly on the instruments, and all accessories including high pass filter, coaxial attenuator, preamplifier and cables.

1.2 TEST FACILITY

The open area test site and conducted measurement facility used to collect the radiated data is located at 360 Herndon Parkway, Suite 1400, Herndon, Virginia 20170. This site has been fully described in a report and approved by the Federal Communications Commission to perform AC line conducted and radiated emissions testing (ANSI C63.4 1992).

1.3 RELATED SUBMITTAL(S)/GRANT(S)

This is a new application submittal. The digital interface and receiver were investigated and found compliant. A DoC report can be provided upon request. The IF, LO and up to the 2nd LO were investigated.

2 EQUIPMENT INFORMATION

2.1 JUSTIFICATION

To complete the test configuration required by the FCC, the transmitter was software-controlled by the manufacturer to operate in a continuous mode. The final data was taken as a substitution measurement. The device is provided with an external antenna connector. EIRP measurement is provided to support the RF exposure requirements for the antennas listed in this application filing.

2.2 EXERCISING THE EUT

The FSU811 is a desk phone transmitter designed to link to a PHS phone network which transmits at a frequency within the range 1880.15 MHz – 1909.85 MHz. Four channels were investigated: 1880.15 MHz, 1893.65 MHz, 1902.35 MHz, and 1909.85 MHz, in three orthogonal planes, with the receiving antenna in both horizontal and vertical polarities, from 1 meter to 4 meters in height.

2.3 MODIFICATIONS

EUT modifications were necessary to mitigate failing emissions. X101 was changed from a Kyocera part number KT18B-EER28NB-19.200M-T to a Murata equivalent, and additional internal shielding was added. There were no deviations from the test standards(s) and/or methods.

2.4 TEST SYSTEM DETAILS

The test sample was received on January 12, 2004. The FCC Identifiers for all equipment, plus descriptions of all cables used in the tested system, are:

TABLE 2-1: EQUIPMENT UNDER TEST (EUT)

PART	MANUFACTURER	MODEL	SERIAL NUMBER	FCC ID	CABLE DESCRIPTION	RTL BAR CODE
4.5 dBi Omni Antenna	UTSTARCOM	QHA0008600	H03793	N/A	Shielded	015647

4.1 ANSI/TIA-603-B-2002, SECTION 2.2.17 TEST PROCEDURE

Substitution method.

4.2 EFFECTIVE ISOTROPIC RADIATED POWER LIMITS - §24.232 (B)TEST PROCEDURE

Mobile/portable stations are limited to 2 watts EIRP peak power and the equipment must employ means to limit the power to the minimum necessary for successful communications.

4.3 RF POWER TEST EQUIPMENT

Notes: Pk = Peak Detector

EIRP Measurements by Substitution Method.

The EUT was placed on a turntable 3 meters from the receive antenna. The field of maximum intensity was found by rotating the EUT approximately 360 degrees and changing the height of the receive antenna from 1 to 4 meters. The field strength was maximized using a calibrated spectrum analyzer using a 1 MHz resolution bandwidth for each channel being tested, and adjusted to an peak and average level using a power meter attached at the end of the receive antenna. A double ridge horn antenna was substituted in place of the EUT. The horn antenna was fed by a signal generator and adjusted until the previous level was attained. This level was recorded and was further corrected by subtracting the cable loss from the signal generator to the transmit antenna and adding the horn gain.

i.e., $S_g - CL + G_n = \text{EIRP (dBm)}$

S_g = Signal Generator Level (dBm)

CL = Cable Loss (dB)

G_n = Transmitting horn antenna gain (dBi)

7 RADIATED SPURIOUS AND HARMONIC EMISSIONS - §2.1053

7.1 RADIATED SPURIOUS AND HARMONIC EMISSIONS - §2.1053

Substitution method. The EUT was terminated with a 50 ohm termination and placed on a turntable 3 meters from the receive antenna. The field of maximum intensity was found by rotating the EUT approximately 360 degrees and changing the height of the receive antenna from 1 to 4 meters. The field strength was recorded from a calibrated spectrum analyzer for each channel being tested. A double ridge horn antenna was substituted in place of the EUT. The horn antenna was fed by a signal generator and adjusted until the previous level was attained. The signal generator level was recorded. It was further corrected by subtracting the cable loss from the signal generator to the dipole and adding the horn gain. The worst case average channel test data is provided.

8 BAND-EDGE COMPLIANCE - PART 24.238

8.1 TEST PROCEDURE:

Delta Marker method : The resolution of the spectrum analyzer is adjusted to 1% of the emission bandwidth after the reference level is adjusted to the EIRP level using a resolution and video bandwidth of 1 MHz. The frequency is centered on the band edge of interest with a span capable of showing the peak; a delta-to-peak is performed with the display line set at – 13 dBm ($43+10\log P$).

TABLE 8-1: BAND-EDGE TEST EQUIPMENT

9 FREQUENCY STABILITY / TEMPERATURE VARIATION - §2.1055

The frequency stability and RF power, measured at the antenna connector using a communications test set as the specified load, are plotted against supply voltage variations and temperature variations at the highest power levels for each modulation type. All measurements are made at the center of the frequency band.

9.1 MEASUREMENT METHOD:

The frequency stability of the transmitter was measured by:

1. Temperature: The temperature was varied from -30°C to +50°C at intervals no more than 10°C throughout the temperature range using an environmental chamber. A period of time sufficient to stabilize all of the components in the equipment shall be allowed prior to each frequency measurement.
2. Primary Supply Voltage: The primary supply voltage was varied from 85% to 115% of the voltage normally at the input to the device or at the power supply terminals if cables are not normally supplied. The EUT was tested down to the battery endpoint.

9.2 FREQUENCY STABILITY TEST EQUIPMENT

TABLE 9-1: FREQUENCY STABILITY TEST EQUIPMENT

RTL Asset #	Manufacturer	Model	Part Type	Serial Number	Calibration Due
900946	Tenney Engineering, Inc	TH65	Temperature Chamber	11380	2/3/05
901020	Hewlett Packard	8564E	Portable Spectrum Analyzer (9 kHz - 40 GHz)	3943A01719	7/15/04

9.3 TIME PERIOD AND PROCEDURE:

1. The carrier frequency of the transmitter was measured at room temperature (25°C to provide a reference).
2. The equipment was subjected to a “soak” at -30°C without any power applied.
3. After the “soak” at -30°C, the measurement of the carrier frequency of the transmitter was made within a three-minute interval after applying power to the transmitter.
4. Frequency measurements were made at 10°C intervals up to +50°C, then back to room temperature. A minimum period of one hour was provided to allow stabilization of the equipment at each temperature level.

9.4 FREQUENCY STABILITY § 24.235

The frequency stability shall be sufficient to ensure that the fundamental emission stays within the authorized frequency block.

9.5 FREQUENCY STABILITY TEST DATA - §2.1055

Operating Frequency (MHz): 1909.35

10 CONCLUSION

The data in this measurement report shows that the UTStarcom, Inc. Model # UTS-FSU811, FCC ID: O6YUTS-FSU811, complies with all the requirements of Parts 2 and 24 of the FCC Rules.
