TEST SUMMARY

The data collected shows that the **HUMAX CO., LTD. (Model NO.: SIR-S300W) Digital Satellite Receiver** complies with §15.107 and §15.109 of the FCC Rules. The highest emission observed, with a minimum margin to the specifications, was at 6.540MHz for conducted emissions with a margin of 5.3dB, and at 856.93MHz for radiated emissions (Pol.: Vertical, EUT Angle : 108degree , ANT. Height : 100cm)with a margin of 4.3dB.

The data and results referenced in this document are true and accurate. The reader is cautioned that there may be errors within the calibration limits of the equipment and facilities. The measurement uncertainty was calculated for all measurements listed in this test report accdg. to NIS 81 / 5 1994.".

1. General Remarks

This Report describes the emission characteristics of the tested product.

If the product will be used with additional equipment other than those mentioned in this report or if the tested product will be used against the manufacture's specifications, the compliance with the relevant standards for the system has to be ensured.

2. Test Facility

2.1 Test Laboratory

Quality control in the testing laboratory is implemented as per ISO/IEC 17025, which is the "General requirements for the competents of calibration and testing laboratory". This laboratory is accredited by NVLAP for NVLAP Lab. Code : 200559-0.

4. Test Set-up and operation modes

4.1 Principle of Configuration Selection

Emission : The equipment under test (EUT) was configured to measure its highest possible radiation level. The test modes were adapted accordingly in reference to the instructions for use.

4.2 Test Operation modes

- The controls of the EUT are set to obtain a picture of normal brightness, contrast, and color saturation. This is obtained with the following luminance values:

Black part of the test pattern 2 cd/m^2

Magenta part of the test pattern 30 cd/m^2

White part of the test pattern 80 cd/m^2

The standard picture is a pattern consisting of vertical color bars in accordance with CCIR Recommendation 471, 100/0/75/0.

5. Test Results EMISSION

5.1 Conducted Emissions

RESULT :

Pass

5.1.1 Measurement Procedure

In the range of 0.45 to 30 k the Conducted Emission was measured in accordance with ANSI C 63.4:2001. The test set-up was made according to ANSI C 63.4:2001. A 1m. x 1.5m. wooden table 80cm. high is placed 40cm. away from the vertical wall and 1.5m away from the side wall of the shielded room. Kyoritsu Model KNW-407 and KNW-242(10 k - 30 k) 50 Ω /50 u Line-Impedance Stabilization Networks(LISNs) are bonded to the shielded room. The EUT is powered from the KNW-242 LISN and the support equipment is powered from the KNW-407 LISN. By varying the configuration of the test sample and the cable routing it was attempted to maximize the emission. For further description of the configuration refer to the picture of the test set-up.

5.3 Antenna-Conducted Power Measurements

RESULT :

Pass

5.3.1 Measurement Procedure

Power on the receive antenna terminals was to be determined by measurement of the voltage Present at these terminals. Antenna-conducted power measurements was performed with the EUT antenna terminals connected directly to measuring instrument (RFI/Field intensity Meter & Frequency Converter) using a impedance-Matching network to connect the measurement Instrument to the antenna terminals of the EUT. Losses in decibels in impedance-matching network used was added to the measured values in dBuV. With the receiver tuned to one of the number of frequency and voltage present at the antenna input terminals over the frequency range specified in the individual equipment requirements, The measurements was repeated with the receiver tuned to another frequency until the number of frequencies had been successively measured. Power in the receive antenna terminals in the ratio of V² /R, where V is the loss-corrected voltage measured at the antenna terminals, and R is the impedance of the measuring instrument.

- 4. Measurement Data's kept in DIGITAL EMC.

The output signal level was the maximum voltage level present at the output terminal of EUT On a particular frequency during normal use. Measurement was made of the levels of the aural carrier, visual carrier and all spurious emissions. Measurement was made by direct connection to the measuring instrument (RFI/Field intensity Meter & Frequency Converter) with Proper impedance matching between the measuring instrument and the EUT. Losses in decibels in impedance-matching network used was added to the measured values in dBuV. The cable was supported between the EUT and the measuring instrument in a straight horizontal line so it had at least 75cm clearance from any conducting surface. The EUT was provided with a typical signal consistent with normal operation. For each channel on which the

5.5 Antenna Transfer Switch Measurements

RESULT :

Pass

5.5.1 Measurement Procedure

Isolation was measured for all positions of an antenna transfer switch on all output channels of The EUT. TV interface device transfer switch is isolation is the difference the levels of a signal Going into one antenna input port of the switch and that of the same signal coming out of Another antenna terminal of the transfer switch. The isolation of an antenna transfer switch Equipped with coaxial connectors was performed by measuring the maximum voltage of the Visual carrier. Using an Impedace-matching device, thelength of coaxial cable was connected between the antenna terminal of the switch and the measuring instrument (RFI/Field intensity Meter & Frequency Converter). The measuring instrument was tuned to the output channel of the EUT in peak mode and the voltage levels was measured and recorded.
