

The add-on module will enable the handheld palm computer to be used as a 1928 to 1949 MHz PCS phone. The communication protocol is GSMK modulation with a maximum output power of 1 watt. No special tune-up procedure is required. The user will only need to plug-in the module, so as to start using it as a phone.

The VisorPhone includes all of the most popular features such as speed dial and call screening. Plus, it handles multiple calls, sends and receives text messages, and fully integrates with the handheld to take advantage of the existing Address Book. To use the VisorPhone, an account must first establish with a mobile phone service provider. The account information is located on the SIM (Subscriber Identity Module) card. The SIM card must be inserted into the VisorPhone before it can use.

For more information on how to program the device, please refer to the User's manual.
