

Operational Description

The car alarm transmitter is a low powered, hand held unit for remote controlling the car locks and other features. See the function descriptions in attached. The transmitter is powered by a 12 volt battery. It is designed to operate on a single fixed frequency at 303 MHz. See the attached block diagram and schematic.

There are 4 buttons trigger the integrated circuit which produces the digital control signals and will modulate the carrier signal.. The modulated output of the RF amplifier stage is coupled to the PCB strip antenna. The antenna is integrated on the PCB .

The transmitter is manually operated by the buttons pushed and will automatically deactivate within 3 seconds after the button being released. This feature is incorporated by the IC internally.

All tuning and verification are performed by the manufacturer and there are no adjustments can be made by the user. No external ground is required or used with this transmitter.
