ELECTROMAGNETIC EMISSIONS TEST REPORT

ACCORDING TO FCC PART 15, SUBPART C, §15.209

FOR
Hi-G-Tek Ltd.

EQUIPMENT UNDER TEST
HI-G-SEAL Hand Held Terminal
model IG-MA-22
FCC ID:OB6-IGMA22-01

Prepared by: 
Mrs. M. Cherniavsky, certif. engineer
Hermon Labs

Approved by: 
Mr. A. Usoskin, QA manager
Hermon Labs

Approved by: 
Mr. Y. Haimovich, Vice President R&D
Hi-G-Tek Ltd.

**Description of equipment under test**

Test items	Hand held terminal, FCC ID:OB6-IGMA22-01
Manufacturer	Hi-G-Tek Ltd. Microelectronics & Asset Tracking Technology
Brand Mark	Hi-G-Tek
Type (Model)	IG-MA-22, P/N TA3158
S/N	000048
Trade Mark	Hi-G-Seal

Applicant information

Applicant's representative	Mr. Rony Cohen, chief engineer
Applicant's responsible person	Mr. Yossi Haimovich, VP R&D
Company	Hi-G-Tek Ltd. Microelectronics & Asset Tracking Technology
Address	16 Hacharoshet St.
P.O. Box	NA
Postal code	60375
City	Or-Yehuda
Country	Israel
Telephone number	011-972-3533 9359
Telefax number	011-972-3533 9225

Test performance

Project Number	13067
Location of the test	Hermon Laboratories, Binyamina, Israel
Test started	November 29, 1998
Test completed	December 3, 1998
Purpose of test	The EUT certification in accordance with CFR 47, part 2, §2.1033
Test specification(s)	FCC part 15, subpart C, §15.209

Through this report a point is used as the decimal separator and the thousands are counted with a comma.
This report is in conformity with EN 45001 and ISO GUIDE 25.
The test results relate only to the items tested.

1 General Information

1.1 Abbreviations and Acronyms

The following abbreviations and acronyms are applicable to this test report:

AC	alternating current
BW	bandwidth
dB	decibel
dBm	decibel referred to one milliwatt
dB(μ V)	decibel referred to one microvolt
dB(μ V/m)	decibel referred to one microvolt per meter
DC	direct current
EUT	Equipment Under Test
GHz	gigahertz
H	height
HL	Hermon Laboratories
HP	Hewlett Packard
Hz	hertz
IF	intermediate frequency
kHz	kilohertz
L	length
m	meter
mm	millimeter
MHz	megahertz
msec	millisecond
mW	milliwatt
NA	Not Applicable
NARTE	National Association of Radio and Telecommunications Engineers, Inc.
QP	quasi-peak (detector)
RBW	resolution bandwidth
RF	Radio Frequency
RE	radiated emission
RMS	root-mean-square
sec	second
V	volt

1.2 Specification References

CFR 47 part 15: October 1997	Radio Frequency Devices.
ANSI C63.2:06/1987	American National Standard for Instrumentation-Electromagnetic Noise and Field Strength, 10 kHz to 40 GHz-Specifications.
ANSI C63.4:1992	American National Standard for Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz.

1.3 EUT Description

The EUT, Hi-G-Seal active hand held terminal (reader), model IG-MA-22, is a part of Hi-G-Seal system, that enables sealing of containers and verifying of assets that need to be sealed against and monitored for any trail to tamper with them. The hand held terminal enables the user to interrogate the active Hi-G-Seals. Every opening or closing of the seal is logged and can be remotely read.

The data stored in the seal can be read by means of a hand held reader using an RF communication link at a distance of up to 1 meter from the seal. The terminal contains a transceiver with a permanently attached antenna. Transmitted frequency is $250 \pm 0.5\%$ kHz, maximum transmitted power is 335 mW. The EUT is powered by 4 x 1.5 V alkaline batteries.

1.4 Statement of Manufacturer

I, Yossi Haimovich, Vice President R&D of Hi-G-Tek Ltd. Microelectronics & Asset Tracking Technology, declare that Hi-G-Seal active hand held terminal, model IG-MA-22, was tested on November 29 and on December 3, 1998 by Hermon Laboratories and which this test report applies to, is identical of the equipment that will be marketed.

The term identical means identical within the variations that can be expected to arise as a result of quantity production technique.

Yossi Haimovich, Vice President R&D
Hi-G-Tek Ltd. Microelectronics & Asset Tracking Technology

2 Test Facility Description

2.1 General

Tests were performed at Hermon Laboratories, which is a fully independent, private EMC, Safety and Telecommunication testing facility. Hermon Laboratories is listed by the Federal Communications Commission (USA) for all parts of Code of Federal Regulations 47 (CFR 47), listed by Industry Canada for radiated measurements (file numbers IC 2186-1 for OATS and IC 2186-2 for anechoic chamber), recognized by VDE (Germany) for witness test, certified by VCCI (Japan), assessed by NMi Certin B.V. (Netherlands) for a number of EMC, Telecommunications and Safety standards, recognized by TUV Sudwest (Germany) for Safety testing, and Accredited by AMTAC (UK) for safety of Medical Devices. The laboratory is accredited by American Association for Laboratory Accreditation (USA) according to ISO GUIDE 25/EN 45001 for EMC, Telecommunications and Product Safety Information Technology Equipment (Certificate No. 839.01).

Address: PO Box 23, Binyamina 30550, Israel.
Telephone: +972-6-628-8001
Fax: +972-6-628-8277

Person for contact: Mr. Alex Usoskin, testing and QA manager.

2.2 Equipment Calibration

The test equipment has been calibrated according to its recommended procedures and is within the manufacturer's published limit of error. The standards and instruments used in the calibration system conform to the present requirements of MIL-STD-45662A. The laboratory standards are calibrated by the third party (traceable to NIST, USA) on a regular basis according to equipment manufacturer requirements.

2.2.1 Uncertainty in Hermon Labs Measurements.

Radiated Emissions (95% Confidence)	Biconical Antenna:
	3m measuring distance : + 4.06 dB Expanded uncertainty
	: - 3.98 dB Expanded uncertainty
	: + 2.032 dB Combined standard uncertainty
	: - 1.99 dB Combined standard uncertainty
	10m measuring distance : + 3.98 dB Expanded uncertainty
	: - 4.08 dB Expanded uncertainty
	: + 1.99 dB Combined standard uncertainty
	: - 2.04 dB Combined standard uncertainty
	Log periodic Antenna:
	3m measuring distance : + 4.74 dB Expanded uncertainty
	: - 3.26 dB Expanded uncertainty
	: + 2.37 dB Combined standard uncertainty
	: - 1.63 dB Combined standard uncertainty
	10m measuring distance : + 3.06 dB Expanded uncertainty
	: - 3.00 dB Expanded uncertainty

2.3 Laboratory Personnel

The two people of Hermon Laboratories that have participated in measurements and documentation preparation are: Mr. Michael Feldman, test technician and Mrs. Marina Cherniavsky - certification engineer.

M. Cherniavsky is a telecommunication engineer certified by the National Association of Radio and Telecommunications Engineers (NARTE, USA).

The Hermon Laboratories' personnel that participated in this project have more than 50 years combined experience time in EMC measurements and electronic products design.

2.4 Statement of Qualification

The test measurement data supplied in this test measurement report having been received by me, is hereby duly certified. The following is a statement of my qualifications:
I am a technician, have obtained 29 years experience in electronics and measurements.
I have been with Hermon Laboratories since 1995.

Name: Mr. Michael Feldman
Position: test technician

Signature: 
Date: December 30, 1998

I hereby certify that this test measurement report was prepared by me and is hereby duly certified. The following is a statement of my qualifications.

I am an engineer, graduated from University in 1971, with an MScEE degree, have obtained 25 years experience in electronic products design and development and have been with Hermon Laboratories since 1991. Also, I am a Telecommunication Class II engineer certified by the National Association of Radio and Telecommunications Engineers, Inc. (USA.), the certificate no. is E2-03410.

Name: Mrs. Marina Cherniavsky
Position: certification engineer

Signature: 
Date: December 30, 1998

3 Radiated Emission Measurements

3.1 Field Strength of Emissions according to § 15.209 (a)

3.1.1 Specified limit

Frequency, MHz	Field strength, microvolts/meter	Measurement distance, meters
0.009 – 0.490	2400/F(kHz)	300

3.1.2 Extrapolation (distance correction) factor

The test was performed in the anechoic chamber at 3 meter test distance, i.e. the distance between measuring antenna and EUT boundary. The results were extrapolated by using the square of an inverse linear distance extrapolation factor DF:

$$DF = 40 \log (D_1/D_2) = 80 \text{ dB, where}$$

D_1 is the 300 meters specified measurement distance

D_2 is the 3 meters test measurement distance.

The DF=80 dB was applied for limit calculation at 3 m test distance measurements.

For 249 kHz frequency the calculated limit is:

$$\text{Limit}_{3m} = \text{Limit}_{300m} + DF = 19.6 \text{ dB}(\mu\text{V/m}) + 80 \text{ dB} = 99.6 \text{ dB}(\mu\text{V/m}).$$

3.1.3 Test Procedure and Results

The EUT was placed on the wooden turntable, as shown in Figure 3.1.1, Photographs 3.1.1, 3.1.2 and was operated in continuous modulated transmitting mode. During testing the EUT was positioned in three orthogonal axes and the measurements were performed with loop antenna. The center of the loop was 1 m above the ground. The frequency range from the lowest generated signal frequency up to 10th harmonic was investigated.

To find maximum radiation the turntable was rotated 360°, the antenna was rotated about its vertical axis and the antenna polarization was changed from vertical to horizontal.

The average detector was used. The test measurement results were recorded into Table 3.1.1 and are shown in Plot 3.1.1.

Radiated Emission Test Setup

3.2 Unintentional Radiated emissions test

3.2.1 Definition of the test

This test was performed to measure radiated emissions from the receiver and incorporated digital device of the EUT and also to verify the EUT full compliance with §15.109, §15.209.

3.2.2 The test set-up configuration, Test Procedure and Results

The radiated emissions measurements of the EUT in receive mode and incorporated digital device were performed in the open field test site at 3 meter measuring distance in the frequency range from 30 MHz to 1 GHz. The EUT was placed on the wooden table as shown in Figure 3.2.1. The biconical and log periodic antennas were used. To find maximum radiation the turntable was rotated 360°, the measuring antenna height changed from 1 to 4 m, and the antenna polarization was changed from vertical to horizontal.

The measurements were performed with the EMI receiver settings: RBW=120 kHz and quasi peak detector.

The test measurement results were recorded in Table 3.2.1 and are shown in Plot 3.2.1.

900	24.1	2000	32.0
920	24.1		

Antenna factor is to be added to receiver meter reading in dB(μ V) to convert to field intensity in dB(μ V/meter).

APPENDIX C- A2LA Accreditation

ACCREDITED LABORATORY

A2LA has accredited

HERMON LABORATORIES
Binyamina, ISRAEL

for technical competence in the field of

Electrical (EMC) Testing

The accreditation covers the specific tests and types of tests listed on the agreed scope of accreditation. This laboratory meets the requirements of ISO/IEC Guide 25:1990 "General Requirements for the Competence of Calibration and Testing Laboratories" (equivalent to relevant requirements of the ISO 9000 series of standards and EN 45001) and any additional program requirements in the identified field of testing.

Presented this 27th day of February, 1997.

President
For the Accreditation Council
Certificate Number 839.01
Valid to March 31, 1999

For tests or types of tests to which this accreditation applies, please refer to the laboratory's Electrical (EMC) Scope of Accreditation

**American Association for Laboratory Accreditation**SCOPE OF ACCREDITATION TO ISO/IEC GUIDE 25:1990 (EN 45001)

HERMON LABORATORIES
P.O. Box 23
Binyamina 30550, Israel
Edward Usoskin Phone: 972 6 6288 001

ELECTRICAL (EMC)

Valid to: March 31, 1999

Certificate Number: 0839.01

In recognition of the successful completion of the A2LA evaluation process,
accreditation is granted to this laboratory to perform the following tests:

Electromagnetic Compatibility

Radiated Emissions Tests
Conducted Emissions Tests

Product Safety Testing

Heat Resistance
Impulse
Clearance & Creepage Distance
Temperature Rise
High Current Arching Ignition
Bonding Resistance

Flammability
Overload
Leakage Current
Hot Wire Ignition
Dielectric Withstanding

Telecommunications Testing

Longitudinal Balance
Environmental Stresses, Surges
DTMF & Pulse Dialing
On Hook, Off Hook DC/AC Impedances
In-Band, Out of Band Signals

Return Losses
Hazardous Voltages
Hearing Aids
Billing Protection

On the following equipment:

Information Technology Equipment (ITE); Industrial, Scientific and Medical
Equipment (ISM); Telecommunications Equipment; Electrical Appliances; Portable
Tools; Motors; Transformers; and Similar Electrical Apparatus

Using the following test methods/specifications/standards:

FCC Part 15 using ANSI C63.4 - 1992
ANSI/UL 1950 - 1994
AS 3260
AS/NZS 1044, AS/NZS 2064, AS/NZS 3548
CISPR 11 - 1990, CISPR 14, CISPR 22 - 1993
EN 55011 - 1991, EN 55014 - 1987, EN 55022 - 1994, EN 60950 - 1993
IEC 950 - 1996
Israeli Ministry of Communications Specification No. 023/96
TS 001, TS 002, TS 004
US Code of Federal Regulation (CFR) 47 Parts 15, 18, and 68

Revised 06/25/97
