### 7.1 AGC Threshold level test

#### 7.1.1 General

This test was performed to measure the AGC threshold of the EUT.

#### 7.1.2 Test procedure

7.1.2.1 The EUT was set up as shown in Figure 7.1.1, energized and its proper operation was checked.

7.1.2.2 The signal generator output was raised until 1 dB increase in the input signal power no longer caused a 1 dB increase in the output power.

7.1.2.3 The mean input and output power was measured with spectrum analyzer as provided in Table 7.1.1.

7.1.2.4 The test results are provided in the table below and the associated plots.

### 7.3 Mean input and output power and booster gain test

#### 7.3.1 General

This test was performed to measure the the mean input and output power at RF antenna connector and to calculate corresponding EUT gain. Specification test limits are given in Table 7.3.1.

Table 7.3.1 Mean output power and booster gain test limits

Transmitter type	Assigned frequency range, MHz	Maximum peak output power, ERP	
		W	dBm
Base and fixed stations	2110 – 2180	1640.0	62.4

Assigned frequency range, MHz	Tested frequency range	Maximum allowed Gain versus frequency response, dB
2110.0 – 2180.0	$F_0 \pm 250\% BW$	Output power (dBm) – input power (dBm)

#### 7.3.2 Test procedure

- 7.3.2.1 The EUT was set up as shown in Figure 7.3.1, energized and its proper operation was checked.
- 7.3.2.2 The signal generator power was adjusted to a level just below the AGC threshold but not more than 0.5 dB below.
- 7.3.2.3 The mean output power was measured with the spectrum analyzer as provided in Table 7.3.2 and the associated plots.
- 7.3.2.4 The corresponding input power was measured with the same settings of the spectrum analyzer.
- 7.3.2.5 The above measurements were repeated with input signal adjusted to be 3 dB above the AGC threshold.
- 7.3.2.6 The EUT gain was calculated as a difference between output and input signal levels.

## 7.4 Out-of-band rejection test

### 7.4.1 General

This test was performed to measure amplifier pass bandwidth. Specification test limits are given in Table 7.4.1.

Table 7.4.1 Out-of-band rejection limits

Assigned frequency range, MHz	Tested frequency range	Modulation envelope reference points*, dBc
2110.0 – 2180.0	$F_0 \pm 250\% BW$	20

\* - Modulation envelope reference points are provided in terms of attenuation below the unmodulated carrier.

### 7.4.2 Test procedure

7.4.2.1 The EUT was set up as shown in Figure 7.4.1, energized and its proper operation was checked.

7.4.2.2 The EUT was set to amplify the unmodulated carrier and the reference peak power level was measured.

7.4.2.3 The tested frequency range was swept with the signal generator and the amplifier 20 dB bandwidth was measured with spectrum analyzer as a frequency delta between the reference points on power envelope and provided in Table 7.4.2 and the associated plots.

## 7.6 Spurious emissions at RF antenna connector test

### 7.6.1 General

This test was performed to measure spurious emissions at RF antenna connector. Specification test limits are given in Table 7.6.1.

Table 7.6.1 Spurious emission limits

Frequency, MHz	Attenuation below carrier, dBc	Spurious emissions, dBm
0.009 – 10th harmonic*	43+10logP**	-13.0

\* - spurious emission limits do not apply to the in band emission within ± 250 % of the authorized bandwidth from the carrier; investigated in course of emission mask testing

\*\* - P is a transmitter output power in watts.

### 7.6.2 Test procedure

7.6.2.1 The EUT was set up as shown in Figure 7.6.1, energized and its proper operation was checked.

7.6.2.2 The EUT was adjusted to produce maximum available for end user RF output power.

7.6.2.3 The spurious emission was measured with spectrum analyzer as provided in Table 7.6.2 and associated plots.

## 7.7 Radiated spurious emission measurements

### 7.7.1 General

This test was performed to measure radiated spurious emissions from the EUT. Specification test limits are given in Table 7.7.1.

**Table 7.7.1 Radiated spurious emission test limits**

Frequency, MHz	Attenuation below carrier, dBc	ERP of spurious, dBm	Equivalent field strength limit @ 3m, dB( $\mu$ V/m) <sup>***</sup>
0.009 – 10 <sup>th</sup> harmonic*	43+10logP <sup>**</sup>	-13	84.4

\* - Excluding the band emission

\*\* - P is transmitter output power in Watts

\*\*\* - Equivalent field strength limit was calculated from maximum allowed ERP of spurious as follows:  
 $E = \sqrt{30 \times P \times 1.64} / r$ , where P is ERP in Watts, 1.64 is numeric gain of ideal dipole and r is antenna to EUT distance in meters

### 7.7.2 Test procedure for spurious emission field strength measurements in 9 kHz to 30 MHz band

7.7.2.1 The EUT was set up as shown in Figure 7.7.1, energized and the performance check was conducted.

7.7.2.2 The specified frequency range was investigated with antenna connected to spectrum analyzer. To find maximum radiation the turntable was rotated 360° and the measuring antenna was rotated around its vertical axis.

7.7.2.3 The worst test results (the lowest margins) were recorded in Table 7.7.2 and shown in the associated plots.

### 7.7.3 Test procedure for spurious emission field strength measurements above 30 MHz

7.7.3.1 The EUT was set up as shown in Figure 7.7.2, energized and the performance check was conducted.

7.7.3.2 The specified frequency range was investigated with antenna connected to spectrum analyzer. To find maximum radiation the turntable was rotated 360° and the measuring antenna height was swept from 1 to 4 m in both, vertical and horizontal, polarizations.

7.7.3.3 The worst test results (the lowest margins) were recorded in Table 7.7.2 and shown in the associated plots.

Hermon Laboratories is accredited by A2LA for calibration according to present requirements of ISO/IEC 17025 and NCSL Z540-1. The accreditation is granted to perform calibration of parameters that are listed in the Scope of Hermon Laboratories Accreditation.

Hermon Laboratories calibrates its reference and transfer standards by calibration laboratories accredited to ISO/IEC 17025 by a mutually recognized Accreditation Body or by a recognized national metrology institute. All reference and transfer standards used in the calibration system are traceable to national or international standards.

In-house calibration of all test and measurement equipment is performed on a regular basis according to Hermon Laboratories calibration procedures, manufacturer calibration/verification procedures or procedures defined in the relevant standards. The Hermon Laboratories test and measurement equipment is calibrated within the tolerances specified by the manufacturers and/or by the relevant standards.
