

Subject: Transmitter Power Control Claim

Part 101.131 states that the transmitter needs "facilities ... to permit the transmitter to be turned on and off independently of any remote control circuits.

Justification:

The Triton IFU complies with this FCC requirement to turn on an off the transmitter independently. The power to any IFU product is delivered to the actual unit at the immediate rear power connection of the unit. This power connection is a quick disconnect connection for ease of power removal and restoration.
