1 General information

1.1 Notes

The test results of this test report relate exclusively to the test item specified in 1.5. The CETECOM ICT Services GmbH does not assume responsibility for any conclusions and generalisations drawn from the test results with regard to other specimens or samples of the type of the equipment represented by the test item. The test report may only be reproduced or published in full. Reproduction or publication of extracts from the report requires the prior written approval of the CETECOM ICT Services GmbH.

Accredited testing laboratory
DAR-registration number : TTI-P-G 166/98-20

Equipment under test : MCW-D 1023
Ambient temperature : 25°C
Relative humidity : 47%

1.3 Details of applicant

Name : **beyerdynamic GmbH & Co.**
Street : **Theresienstraße 8**
City : **74003 Heilbronn**
Country : **Germany**
Telephone: **+49 (0) 7131 61 71 55**
Telefax : **+49 (0) 7131 6 04 59**
Contact : **Mr. Ulrich Roth**
Telephone: **+49 (0) 7131 61 71 55**

1.4 Application details

Date of receipt of application : 05.03.2001
Date of receipt of test item : 05.03.2001
Date of test : 05.03.2001 – 15.03.2001
Re issued : 03.05.2002

1.5 Test item

Type of equipment	:	**Digital Wireless Communication System**
Type designation	:	**MCW-D Table Unit (4 similar types 1011, 1013, 1021 and 1023)**
Manufacturer	:	applicant
Street	:	
City	:	
Country	:	
Serial number	:	
Additional informations: :		
Frequency	:	2400 – 2483,5 MHz
Type of modulation	:	10M0P7D (DSSS) Ch.Sep. : 5 MHz
Number of channels	:	16
Antenna	:	internal print antenna
Power supply	:	14.4 V DC by Accu
Output power rad.	:	14 dBm
Type of equipment	:	Class B
Temperature range	:	-10°C - +55°C

1.6 Test standards: FCC Part 15 §15.247 / CANADA RSS-210

Equipment under test : MCW-D 1023
Ambient temperature : 25°C
Relative humidity : 47%

2 Technical test

2.1 Summary of test results

The radiated measurements were performed vertical and horizontal over the whole frequency range.We start at 1 m high with vertical receiving antenna and rotate the dish continuously. During rotation we use the antenna lift system to vary the high from 1 to 4 m. So we find maximum radiation output. At this points we do manual remeasurements. After this we do the same measurements in horizontal position of the receiving antenna. This (horizontal and vertical) is made for all the three planes of the test sample. We use the maximum received results. The detector function and selection of bandwidth are according ANSI C63.2-1996 item 8.2.1 and ANSI C63.4-1992 Item 4.2.
Antennas are conform with ANSI C63.2-1996 item 15.
150 kHz - 30 MHz: Quasi Peak measurement, 9kHz Bandwidth, passive loop antenna.
30 MHz - 200 MHz: Quasi Peak measurement, 120KHz Bandwidth, biconical antenna
200MHz - 1GHz: Quasi Peak measurement, 120KHz Bandwidth, log periodic antenna
>1GHz: Average, RBW 1MHz, VBW 10 MHz, waveguide horns and standard gain horns.
All measurement settings are according to FCC 15.35, 15.205, 15.209, 15.247 and the „Measurement guidelines for FHSS systems“, especially regarding the radiated measurements.

It was not possible to do RX-only measurements as according to this communication system the tx is transmitting in packets and listens in the Tx gaps. So we do not have a special RX-only mode.
The AF output has been covered, because at the moment special headphones can be connected only. If you need this output please contact beyerdynamic.
The samples use the same RF part and the same PCB board.
The only difference is in the number of pushbuttons(1 or 3) and with or without loudspeaker.

The product fullfills also the requirements for CANADA RSS-210
No deviations from the technical specification(s) were ascertained in the course of the tests.

Final verdict : PASS

Technical responsibility for area of testing :

Date	Section	Name	Signature
10.Apr.2002	RSC 8414	Ames H.

Equipment under test : MCW-D 1023
Ambient temperature : 25°C
Relative humidity : 47%

2.2 Testreport

TEST REPORT

Testreport no. : 4-0306-02-02/01

Equipment under test : MCW-D 1023
Ambient temperature : 25°C
Relative humidity : 47%

TEST REPORT REFERENCE

LIST OF MEASUREMENTS

Equipment under test : MCW-D 1023
Ambient temperature : 25°C
Relative humidity : 47%

Antenna Gain **SUBCLAUSE § 15.204**

The antenna gain of the complete system is calculated by the difference of conducted power of the module and the radiated power in EIRP.

	low channel peak	mid channel peak	high channel peak
Conducted power	19.2 dBm	19.1 dBm	18.7 dBm
Radiated power (antenna inside housing)	14.2 dBm	14.5 dBm	14.4 dBm
Gain	-5.0 dB	-4.6 dB	-4.3 dB

The calculated antenna gain is between –4.3and -5.0 dB for the internal print antenna.

Equipment under test MCW-D 1023
Ambient temperature : 25°C
Relative humidity : 47%

Spectrum Bandwith of a DSSS System

§15.247(a)

6 dB bandwidth

TEST CONDITIONS		6 dB BANDWIDTH (kHz)		
Frequency (MHz)		2408.5 MHz	2439.5 MHz	2474.0 MHz
T_{nom}(25)°C	V_{nom}(14.4)V	3607	3607	3607
Measurement uncertainty		±1kHz		

RBW / VBW as provided in the „Measurement Guidelines“ (DA 00-705, March 30, 2000)

LIMIT **SUBCLAUSE §15.247(a) (2)**

The minimum 6dB bandwith shall be at least 500 KHz

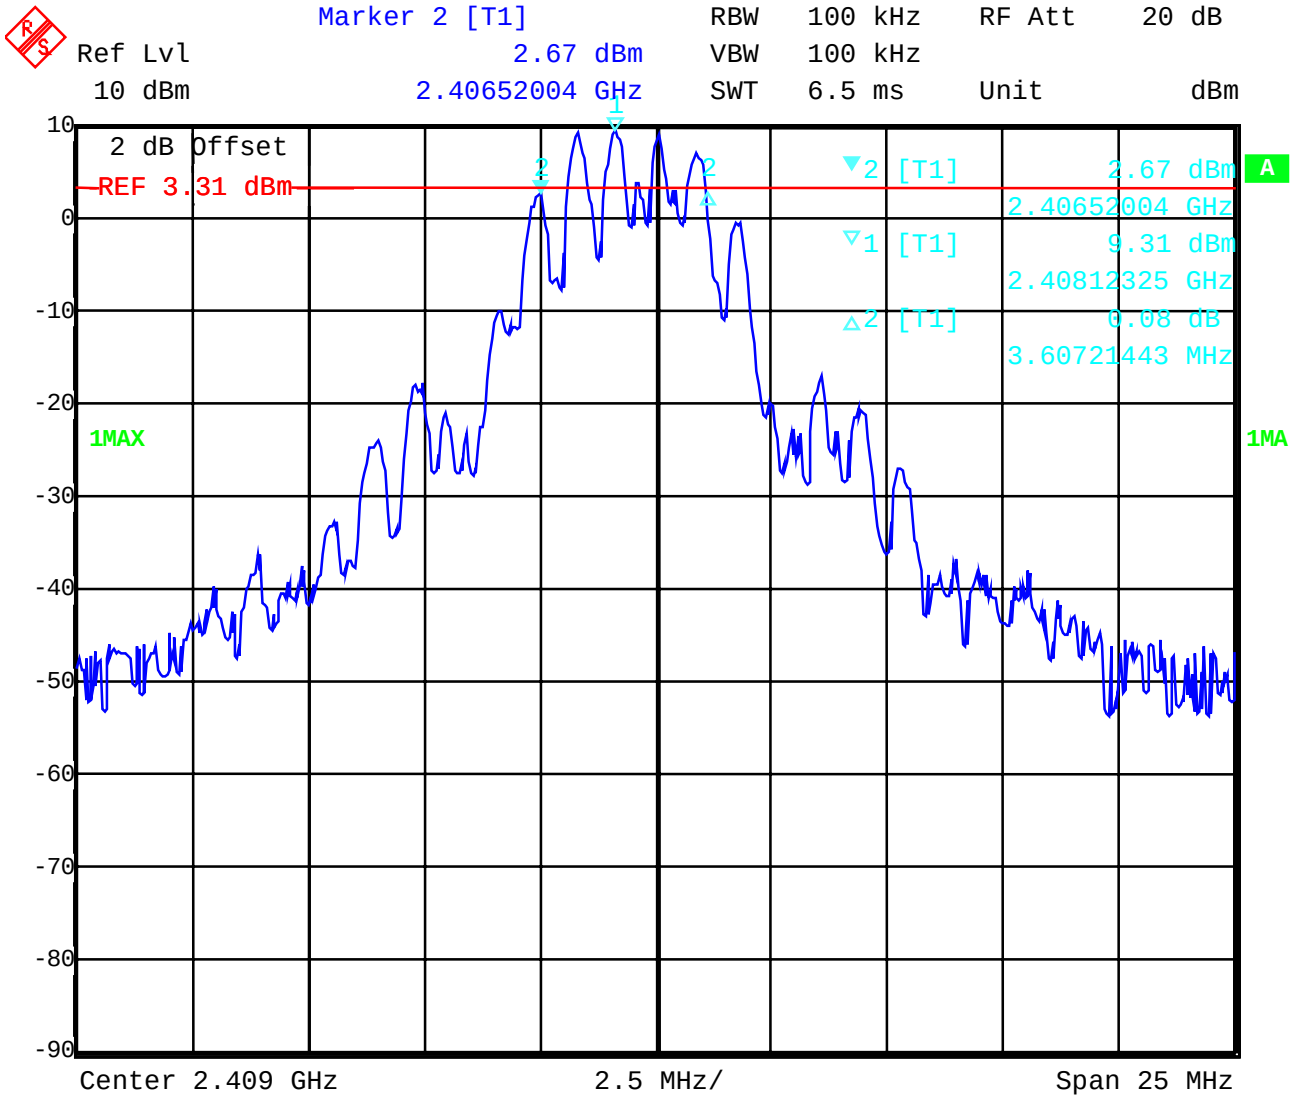
REFERENCE NUMBER(S) OF TEST EQUIPMENT USED
(for reference numbers see test equipment listing)
17 - 24

Equipment under test : MCW-D 1023
Ambient temperature : 25°C
Relative humidity : 47%

Spectrum Bandwith of a DSSS System **§15.247(a)**
6 dB bandwidth

Channel 1

The measurement was performed with the same RF-module tested with 4-0306-02-01/01.



Equipment under test : MCW-D 1023
Ambient temperature : 25°C
Relative humidity : 47%

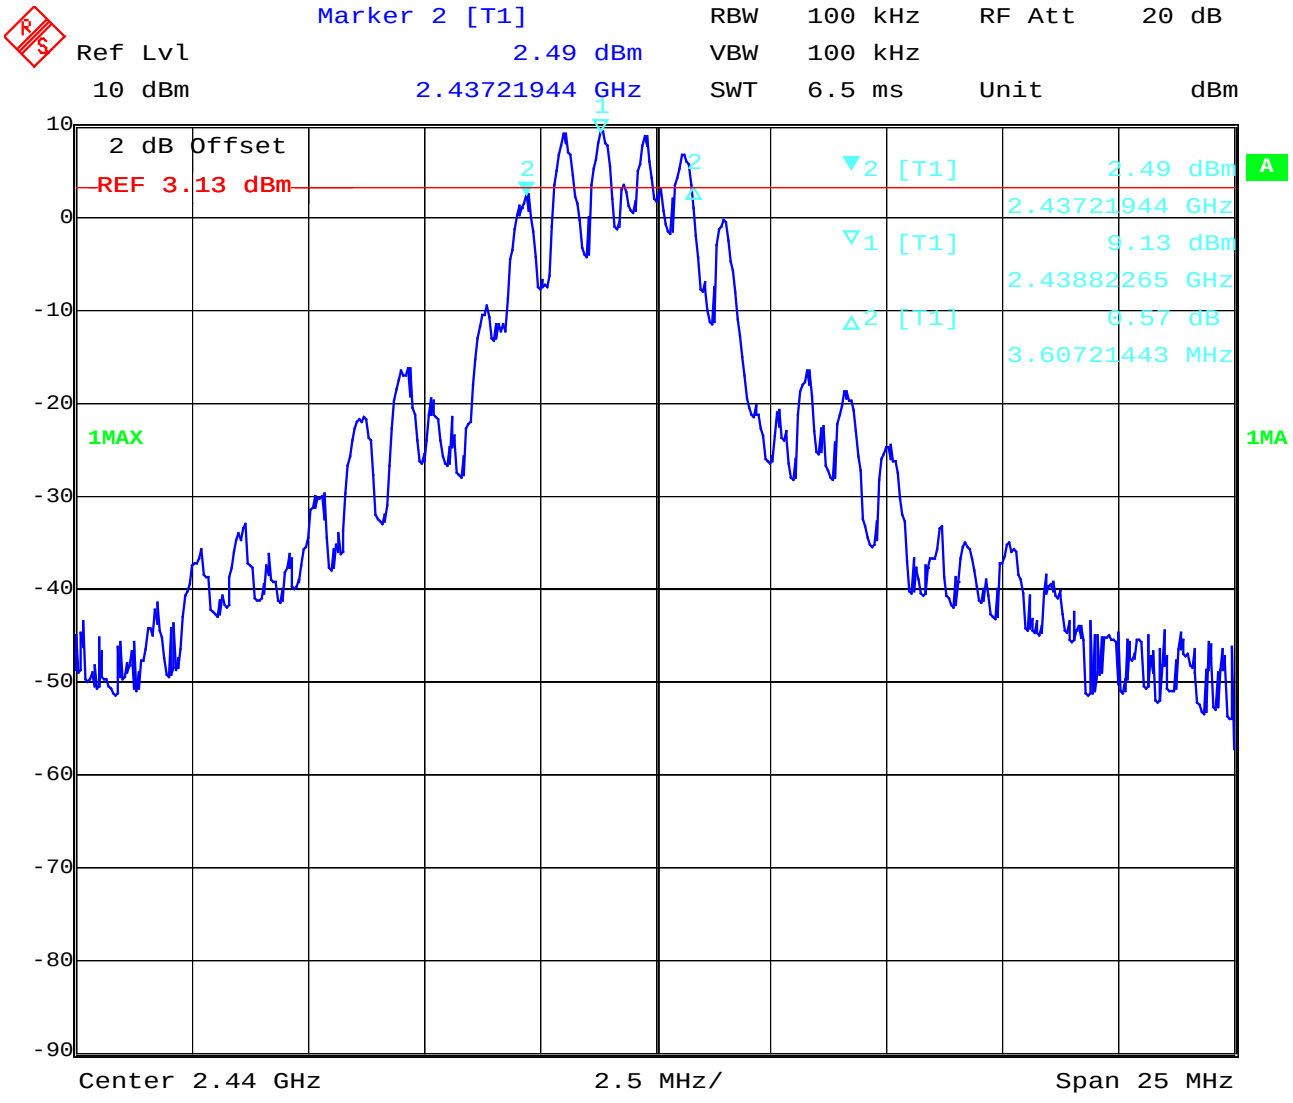
Spectrum Bandwith of a DSSS System

§15.247(a)

6 dB bandwidth

Channel 2

The measurement was performed with the same RF-module tested with 4-0306-02-01/01.

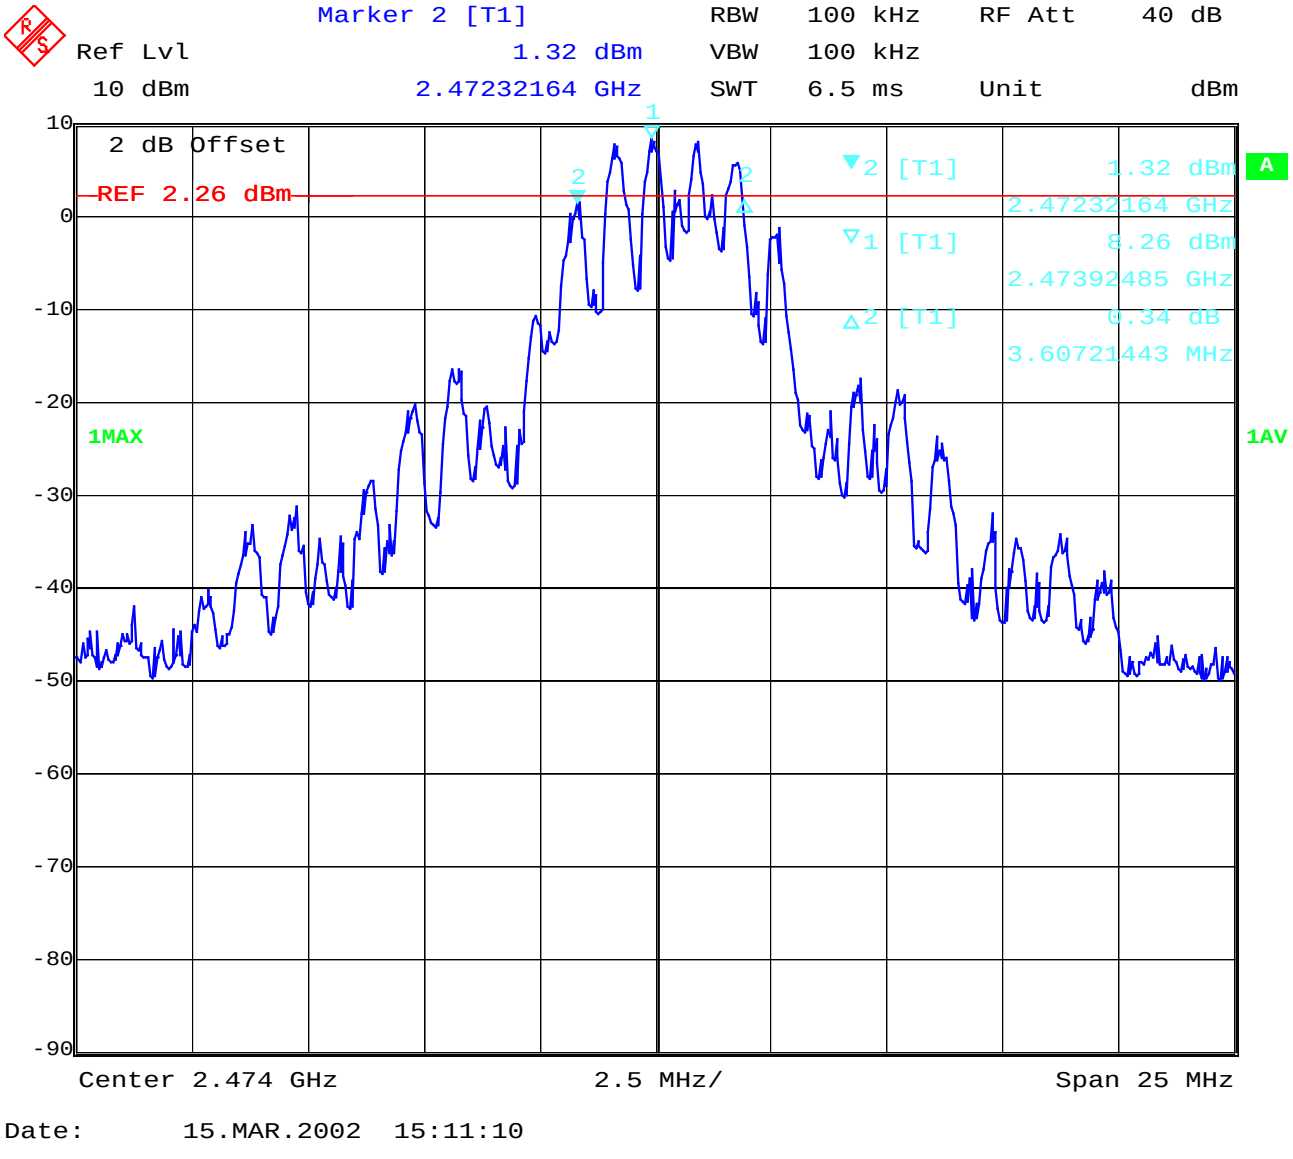


Equipment under test : MCW-D 1023
Ambient temperature : 25°C
Relative humidity : 47%

Spectrum Bandwith of a DSSS System **§15.247(a)**
6 dB bandwidth

Channel 3:

The measurement was performed with the same RF-module tested with 4-0306-02-01/01.



Equipment under test : MCW-D 1023
Ambient temperature : 25°C
Relative humidity : 47%

MAXIMUM PEAK OUTPUT POWER (CONDUCTED) **SUBCLAUSE § 15.247 (b) (1)**

TEST CONDITIONS		MAXIMUM PEAK OUTPUT POWER (mW)		
Frequency (MHz)		2408.5 MHz	2439.5 MHz	2474.0 MHz

Maximum deviation from output power under extreme test conditions (dBc)		0.5	0.5	0.5
Measurement uncertainty		±3dB		

RBW/VBW : 10 MHz

LIMIT **SUBCLAUSE § 15.247 (b) (1)**

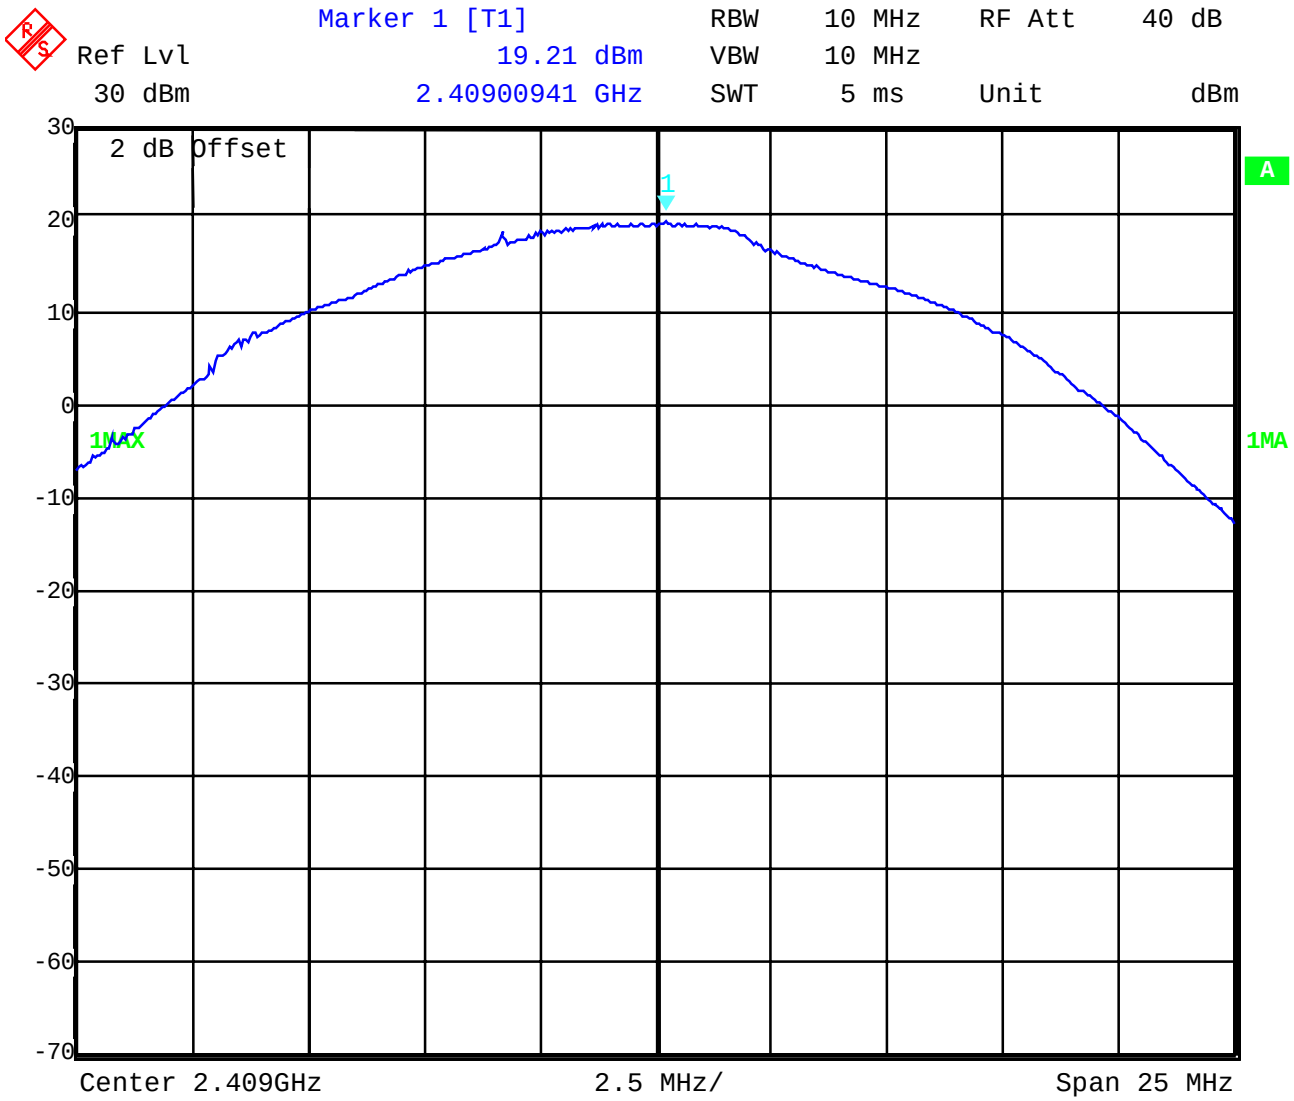
Frequency range	RF power output
2400-2483.5 MHz	1.0 Watt/ 30dBm

Equipment under test : MCW-D 1023
Ambient temperature : 25°C
Relative humidity : 47%

MAXIMUM PEAK OUTPUT POWER (CONDUCTED)

SUBCLAUSE § 15.247 (b) (1)

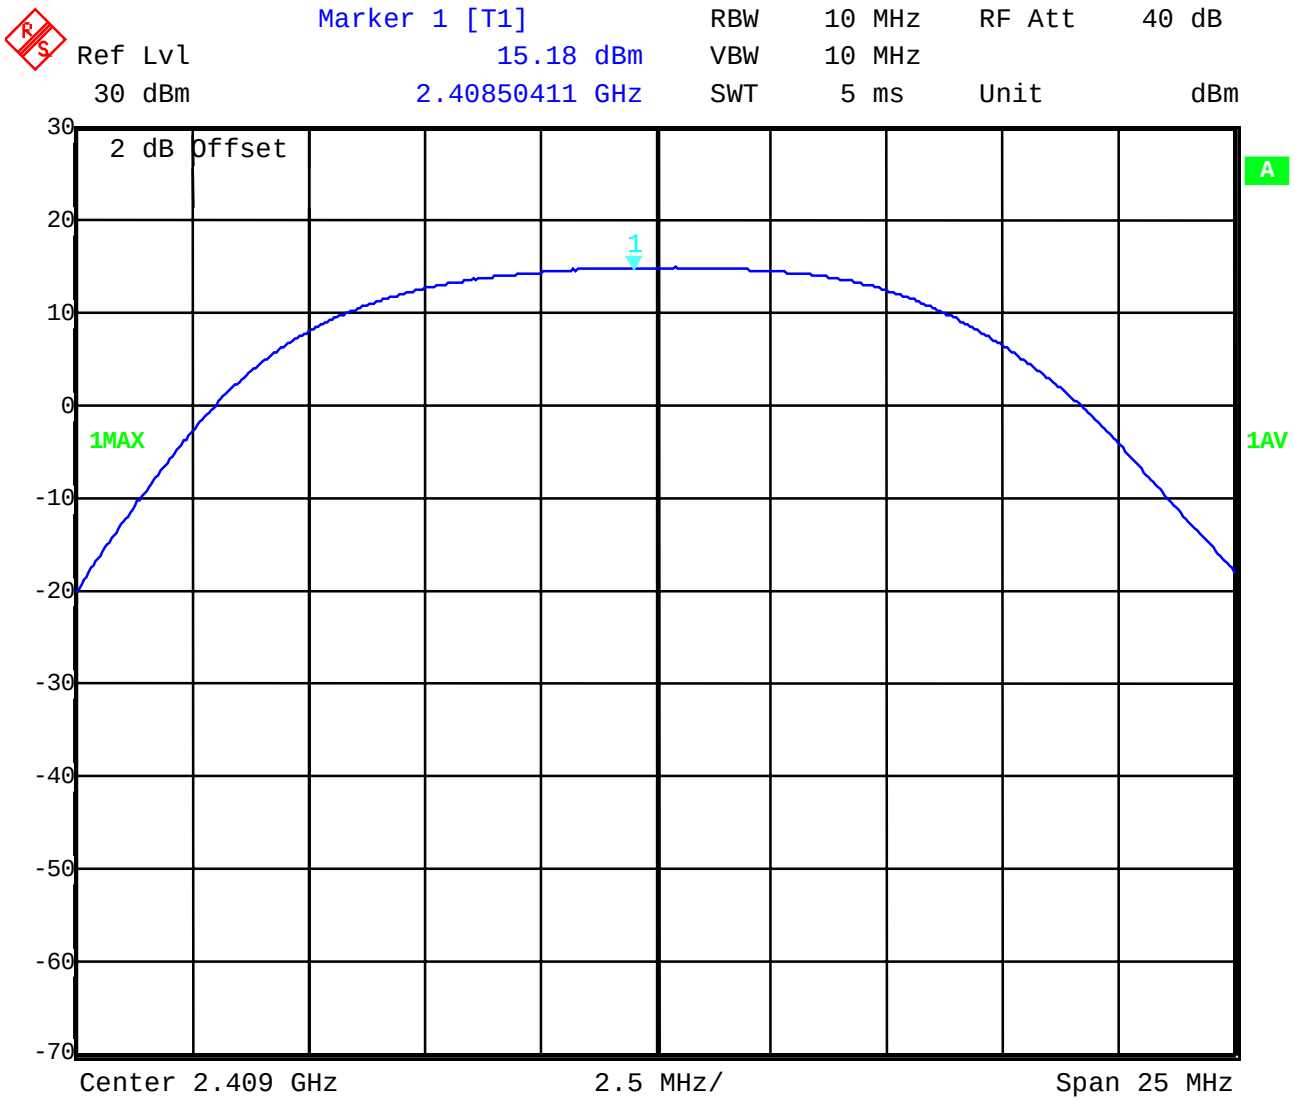
low channel peak



Equipment under test : MCW-D 1023
Ambient temperature : 25°C
Relative humidity : 47%

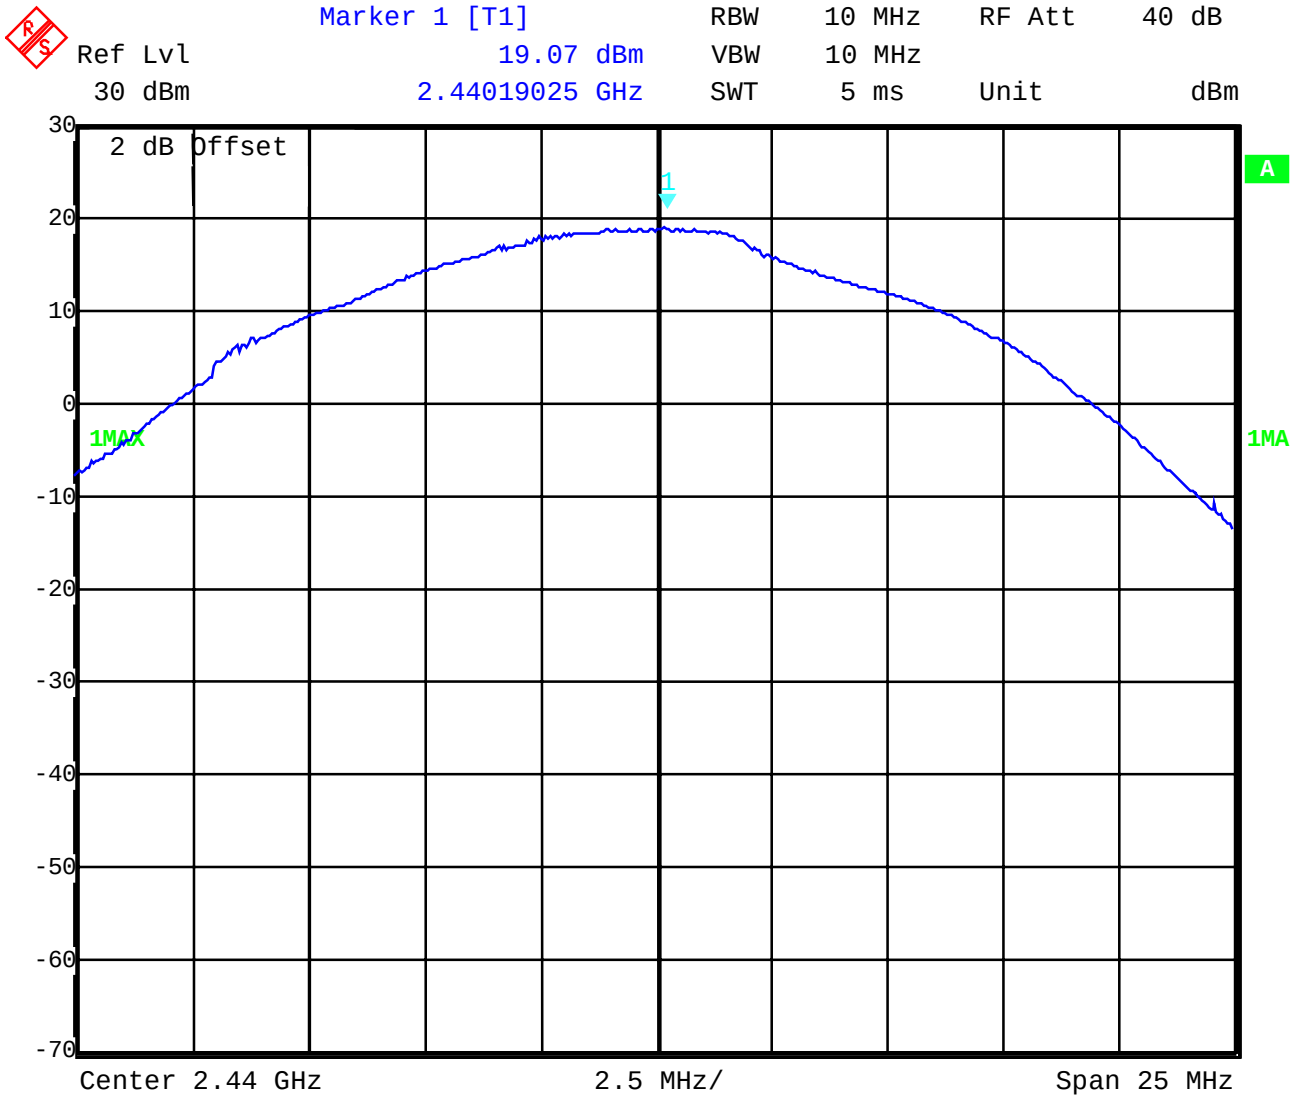
MAXIMUM PEAK OUTPUT POWER (CONDUCTED) **SUBCLAUSE § 15.247 (b) (1)**

low channel average



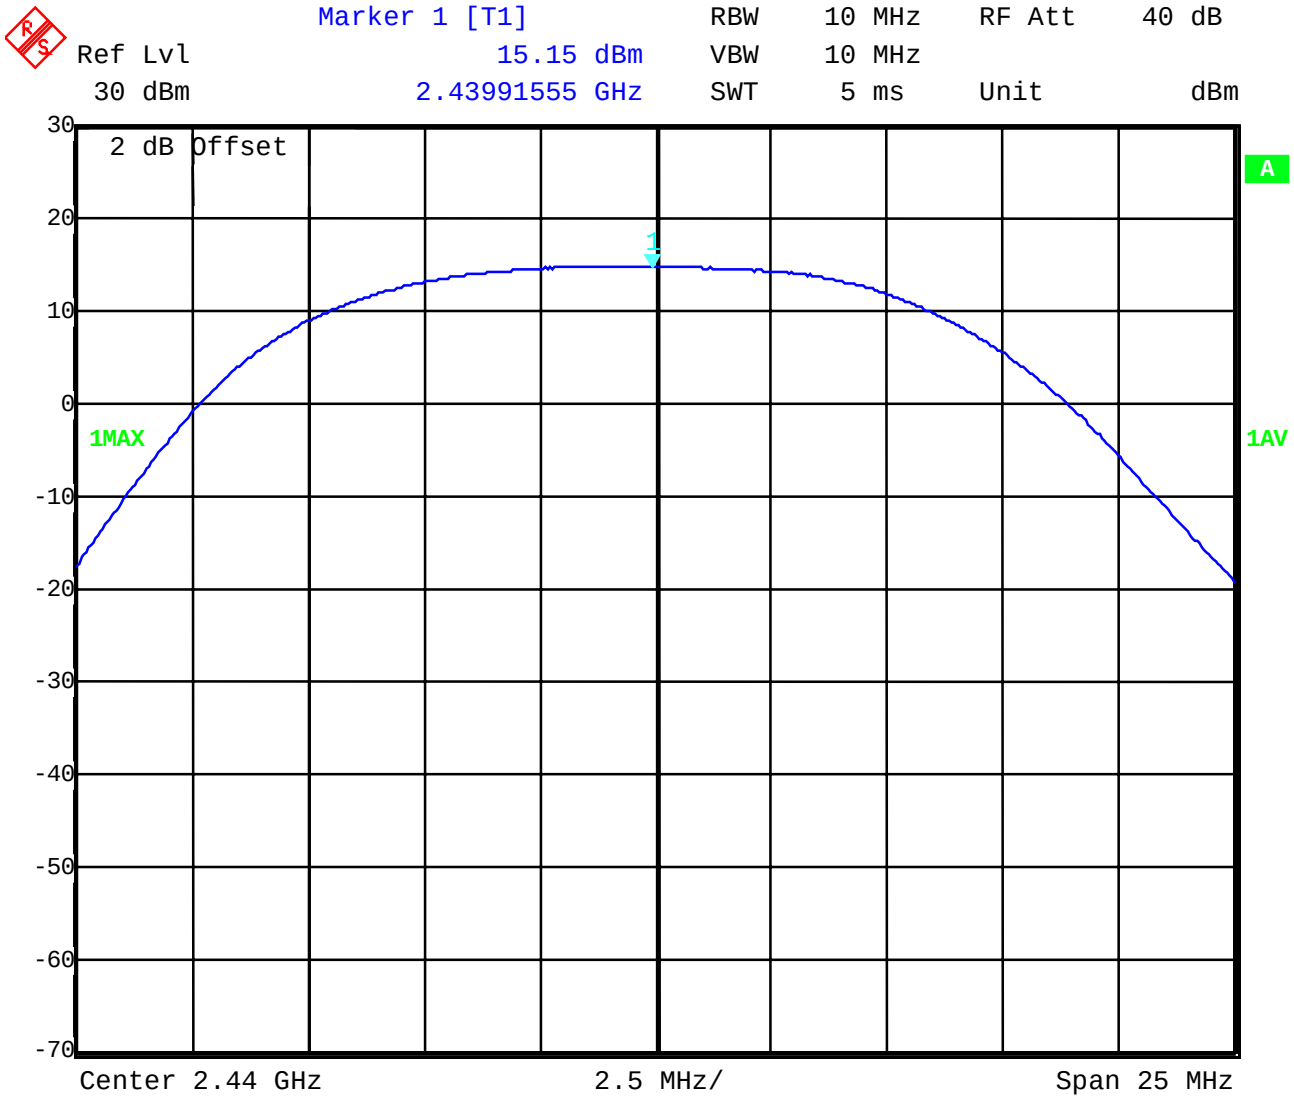
Equipment under test : MCW-D 1023
Ambient temperature : 25°C
Relative humidity : 47%
MAXIMUM PEAK OUTPUT POWER (CONDUCTED) **SUBCLAUSE § 15.247 (b) (1)**

mid channel peak



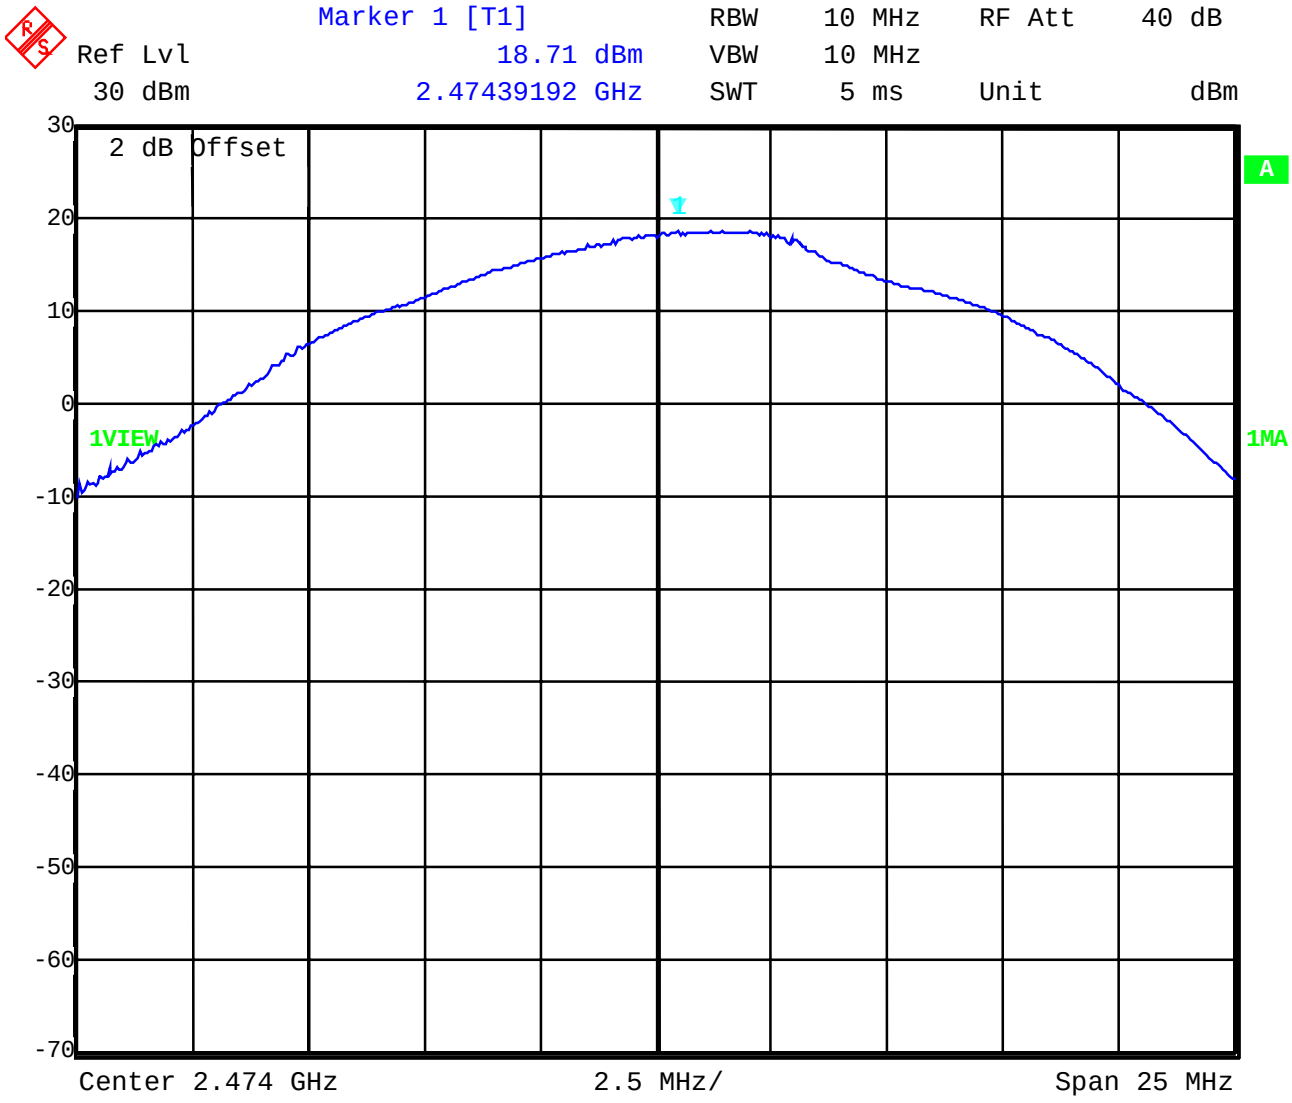
Equipment under test : MCW-D 1023
Ambient temperature : 25°C
Relative humidity : 47%
MAXIMUM PEAK OUTPUT POWER (CONDUCTED) **SUBCLAUSE § 15.247 (b) (1)**

mid channel average



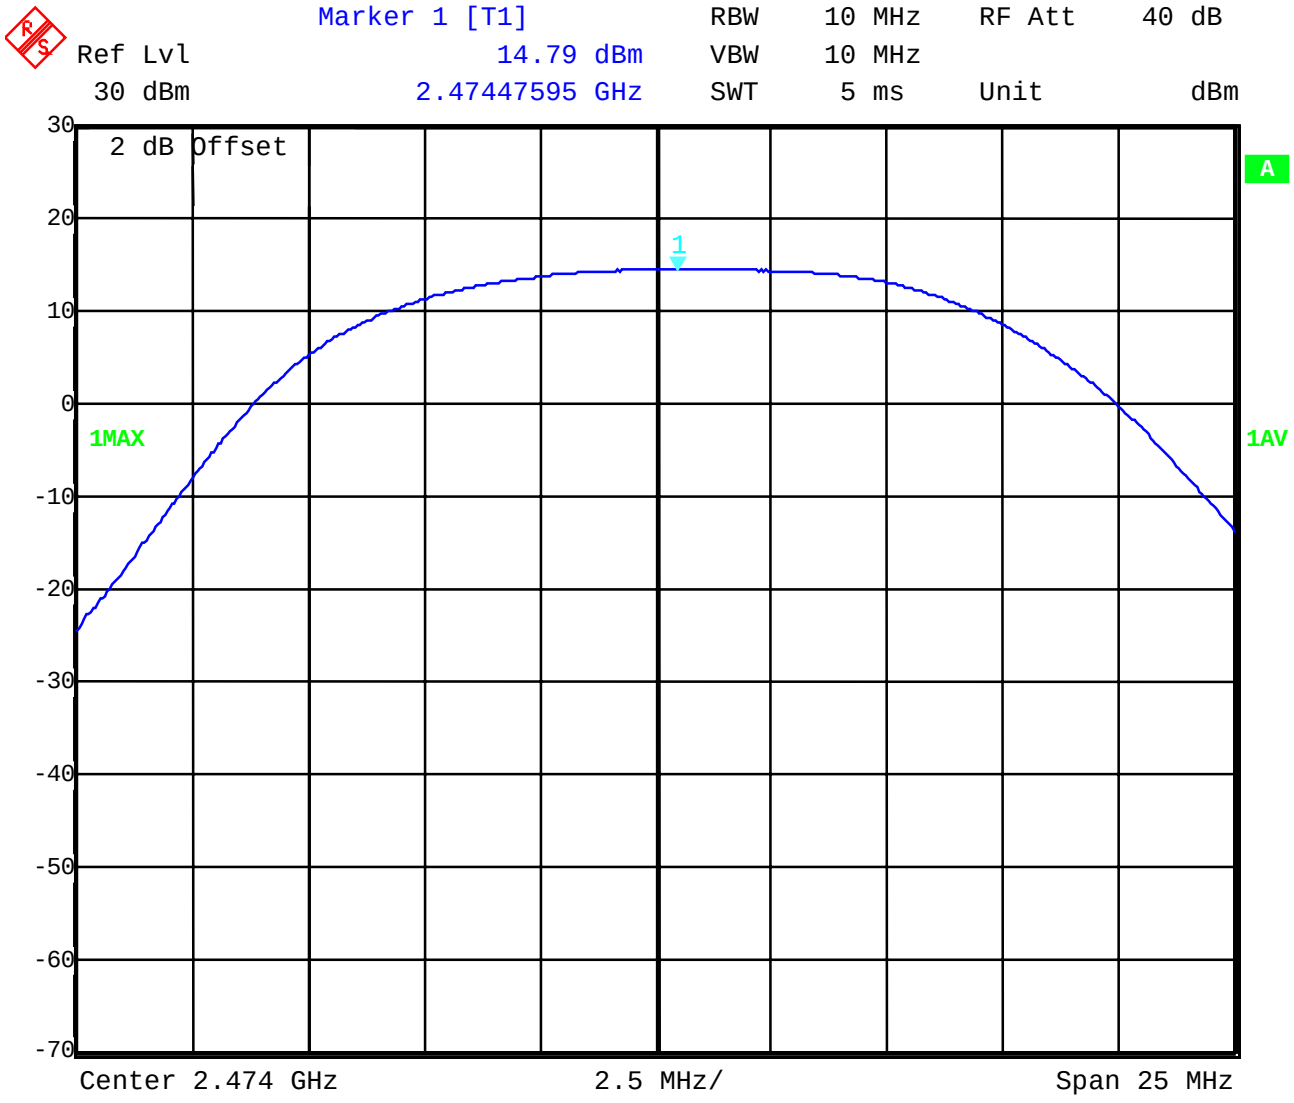
Equipment under test : MCW-D 1023
Ambient temperature : 25°C
Relative humidity : 47%
MAXIMUM PEAK OUTPUT POWER (CONDUCTED) **SUBCLAUSE § 15.247 (b) (1)**

high channel peak



Equipment under test : MCW-D 1023
Ambient temperature : 25°C
Relative humidity : 47%
MAXIMUM PEAK OUTPUT POWER (CONDUCTED) **SUBCLAUSE § 15.247 (b) (1)**

high channel average



Equipment under test : MCW-D 1023
Ambient temperature : 25°C
Relative humidity : 47%

MAXIMUM PEAK OUTPUT POWER (RADIATED) **SUBCLAUSE § 15.247 (b) (1)**

TEST CONDITIONS		MAXIMUM PEAK OUTPUT POWER (mW)		
Frequency (MHz)		2408.5 MHz	2439.5 MHz	2474.0 MHz
T_{nom}(25)°C	V_{nom}(14.4)V	14.2 dBm 26.3 mW	14.5 dBm 28.2 mW	14.4 dBm 27.5 mW
Maximum deviation from output power under extreme test conditions (dBc)		n.a.	n.a.	n.a.
Measurement uncertainty		±3dB		

RBW/VBW : 10 MHz

Measured at a distance of 3m

LIMIT **SUBCLAUSE § 15.247 (b) (1)**

Frequency range	RF power output
2400-2483.5 MHz	1.0 Watt

REFERENCE NUMBER(S) OF TEST EQUIPMENT USED
(for reference numbers see test equipment listing)
17 - 24

Equipment under test : MCW-D 1023
Ambient temperature : 25°C
Relative humidity : 47%

Power spectral density **§15.247 (d)**

The measurement was performed with the same RF-module tested with 4-0306-02-01/01.

TEST CONDITIONS		RF POWER LEVEL IN 3 kHz BW		
Frequency (MHz)		2408.5	2439.5	2474.0
T_{nom}(25)°C	V_{nom}(14.4)V	-4.45 dBm	-4.36 dBm	-3.86 dBm
Maximum deviation from output power under extreme test conditions (dBc)				
Measurement uncertainty		±3dB		

The measurement was performed with the power density funktion of the analyzer. The readout is related to 1 Hz BW. For 3 kHz BW we have to add 34.8 dB.

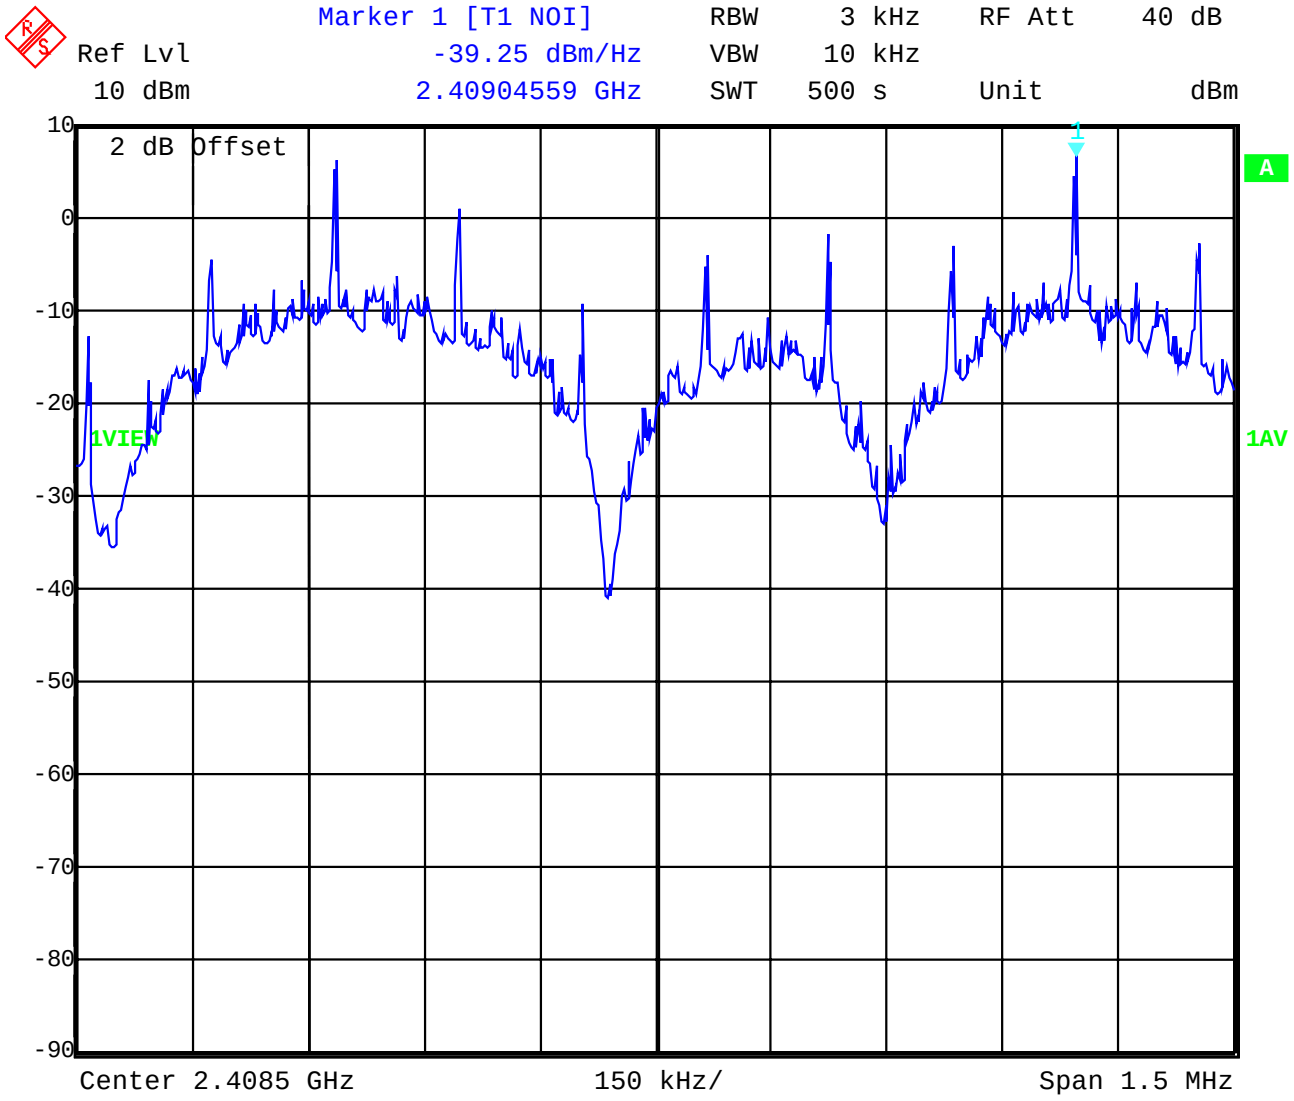
LIMIT **SUBCLAUSE §15.247(d)**

The peak power spectral density shall not be greater than 8 dBm in any 3 kHz band

REFERENCE NUMBER(S) OF TEST EQUIPMENT USED
(for reference numbers see test equipment listing)
17 - 24

Equipment under test : MCW-D 1023
Ambient temperature : 25°C
Relative humidity : 47%

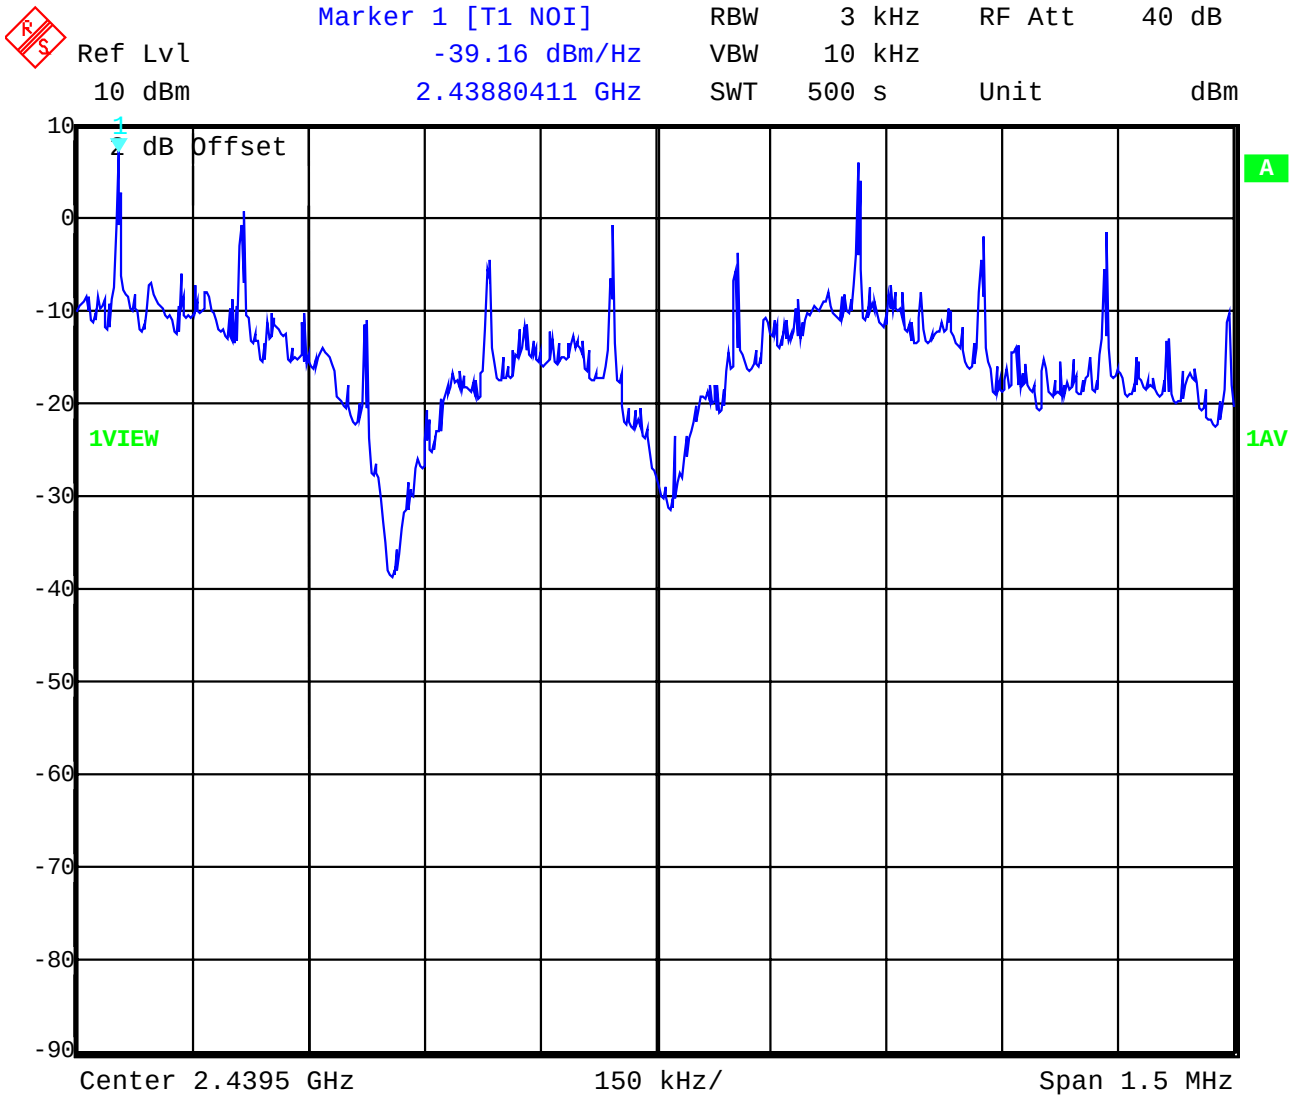
POWER SPECTRAL DENSITY **SUBCLAUSE § 15.247 (d)**
2408.5 MHz



LIMIT **SUBCLAUSE §15.247(d)**

The peak power spectral density shall not be greater than 8 dBm in any 3 kHz band

Equipment under test : MCW-D 1023
Ambient temperature : 25°C
Relative humidity : 47%
POWER SPECTRAL DENSITY **SUBCLAUSE § 15.247 (d)**
2439.5 MHz

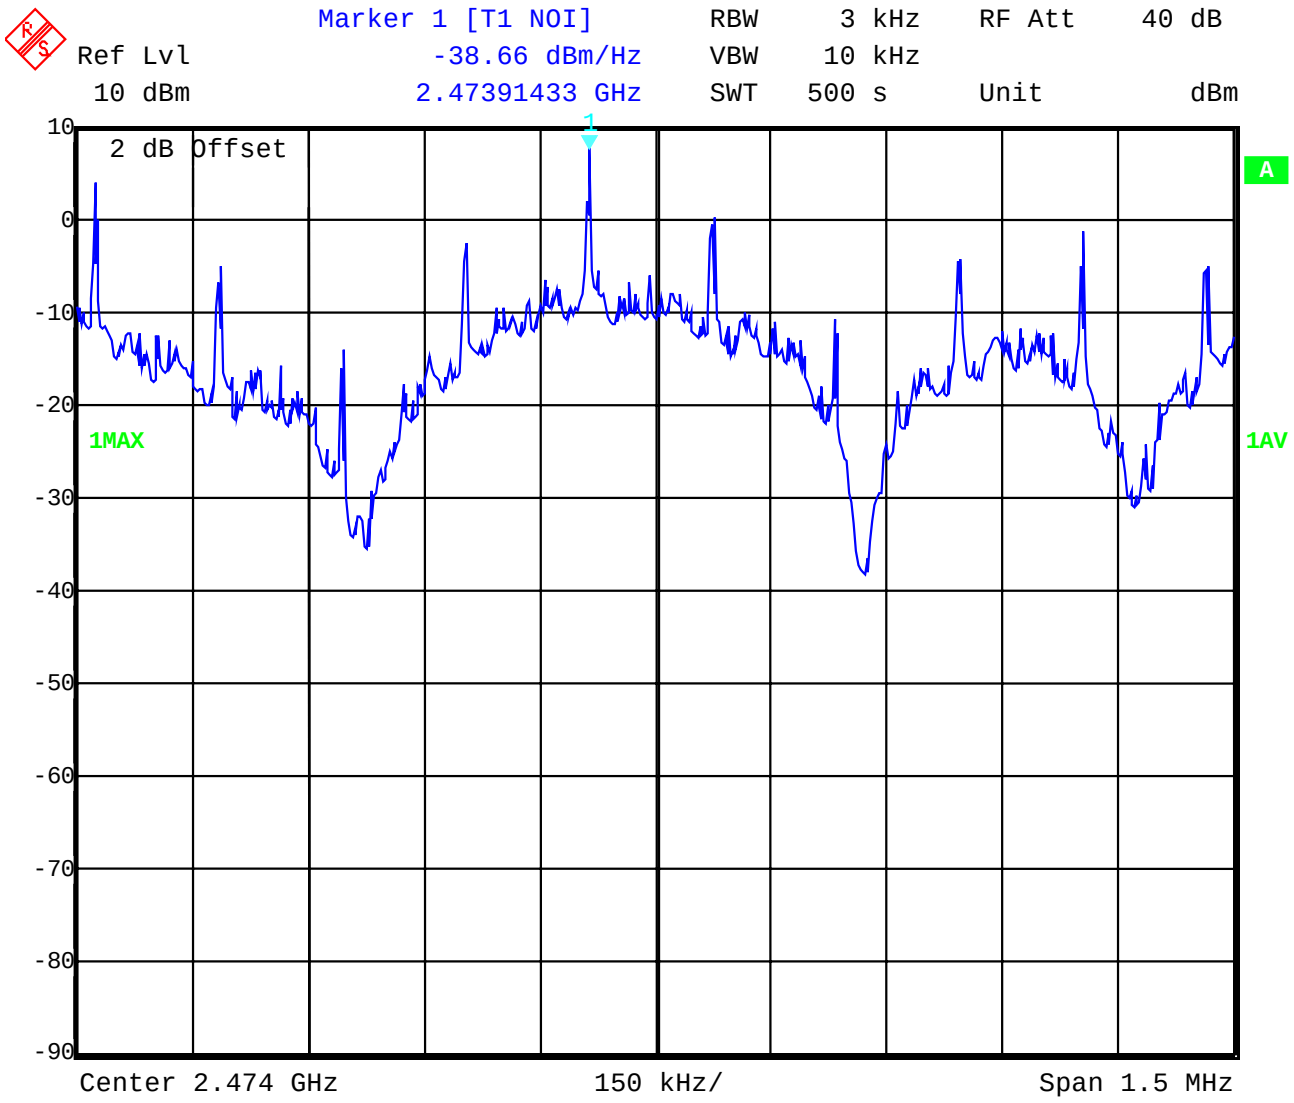


LIMIT **SUBCLAUSE §15.247(d)**

The peak power spectral density shall not be greater than 8 dBm in any 3 kHz band

Equipment under test : MCW-D 1023
Ambient temperature : 25°C
Relative humidity : 47%

POWER SPECTRAL DENSITY **SUBCLAUSE § 15.247 (d)**
2474 MHz



LIMIT **SUBCLAUSE §15.247(d)**

The peak power spectral density shall not be greater than 8 dBm in any 3 kHz band

Equipment under test : MCW-D 1023
Ambient temperature : 25°C
Relative humidity : 47%

Band-edge compliance of conducted emissions §15.247 (c)

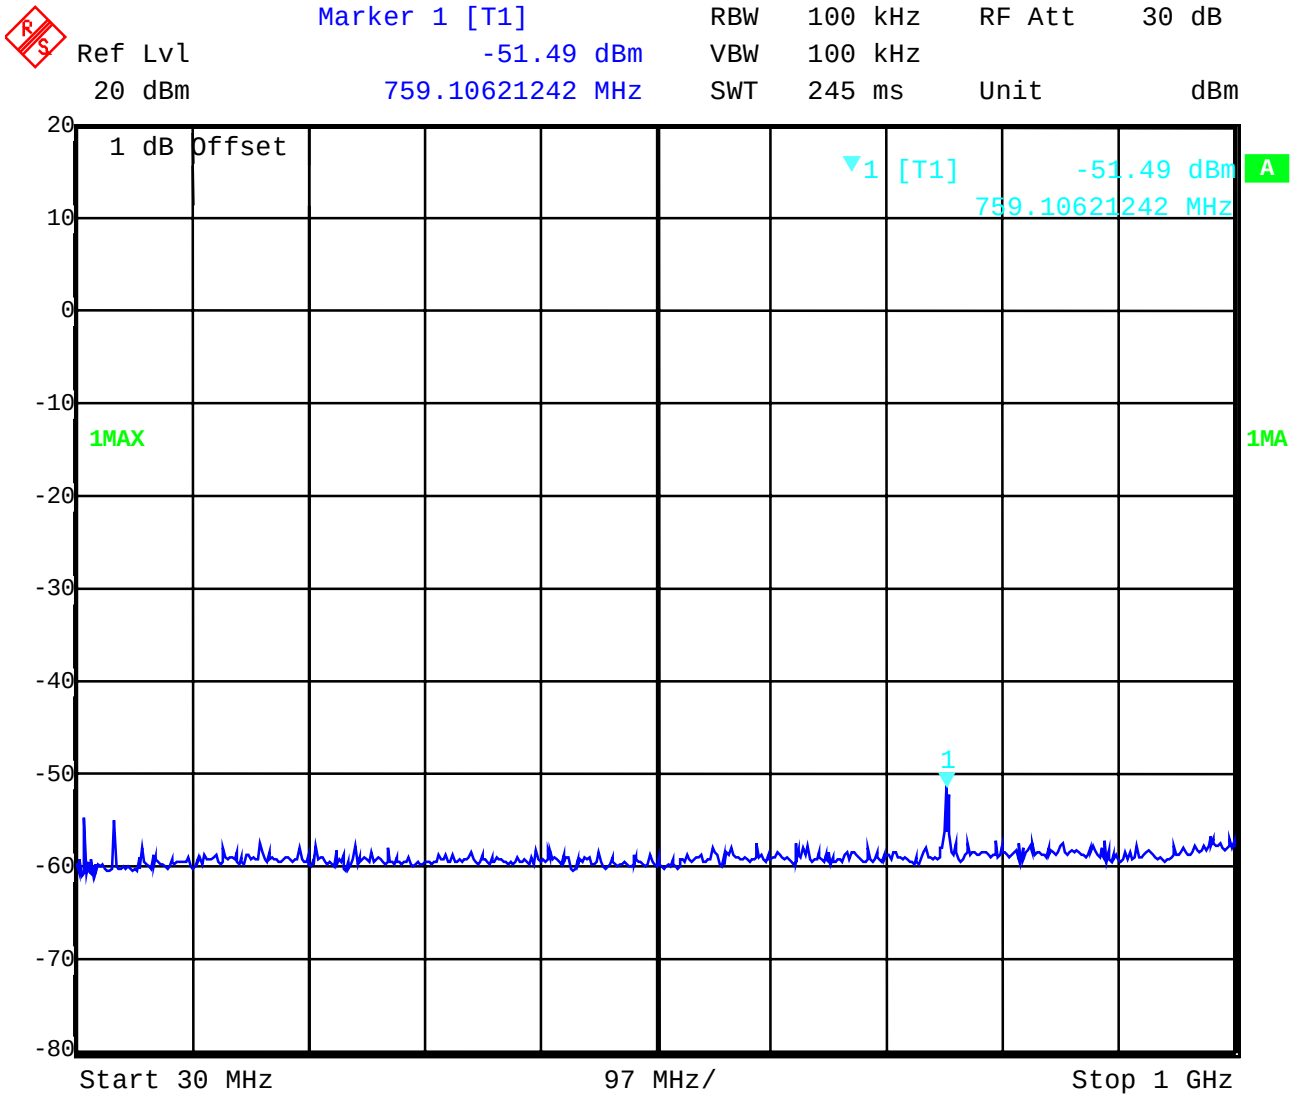
high channel
The measurement was performed with the same RF-module tested with 4-0306-02-01/01.

Equipment under test : MCW-D 1023
Ambient temperature : 25°C
Relative humidity : 47%

SPURIOUS EMISSION LIMITATION **§ 15.247 (c) (1)**
CONDUCTED
The measurement was performed with the same RF-module tested with 4-0306-02-01/01.

All unwanted conducted emissions are << 20 dBc.

Low channel



Equipment under test : MCW-D 1023
Ambient temperature : 25°C
Relative humidity : 47%
SPURIOUS EMISSION **§ 15.247 (c) (1)**

Measurement uncertainty		± 3dB			

LIMITS SUBCLAUSE § 15.247 (c)

In any 100 kHz bandwidth outside the frequency band at least 20dB below the highest level of the desired power. In addition, radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.209(a) (see §15.205(c)).

Equipment under test : MCW-D 1023
Ambient temperature : 25°C
Relative humidity : 47%

EMISSION LIMITATIONS- Radiated § 15.247 (c) (1)

3 channels simultan up to 4 GHz, carrier suppressed by a stub tuner to avoid overstearing.

This is only a scan.
Measurements were performed by main with 100/120 kHz BW for CISPR Quasipeak below 1 GHz, above 1 GHz with 1MHz RBW/VBW at average and peak.

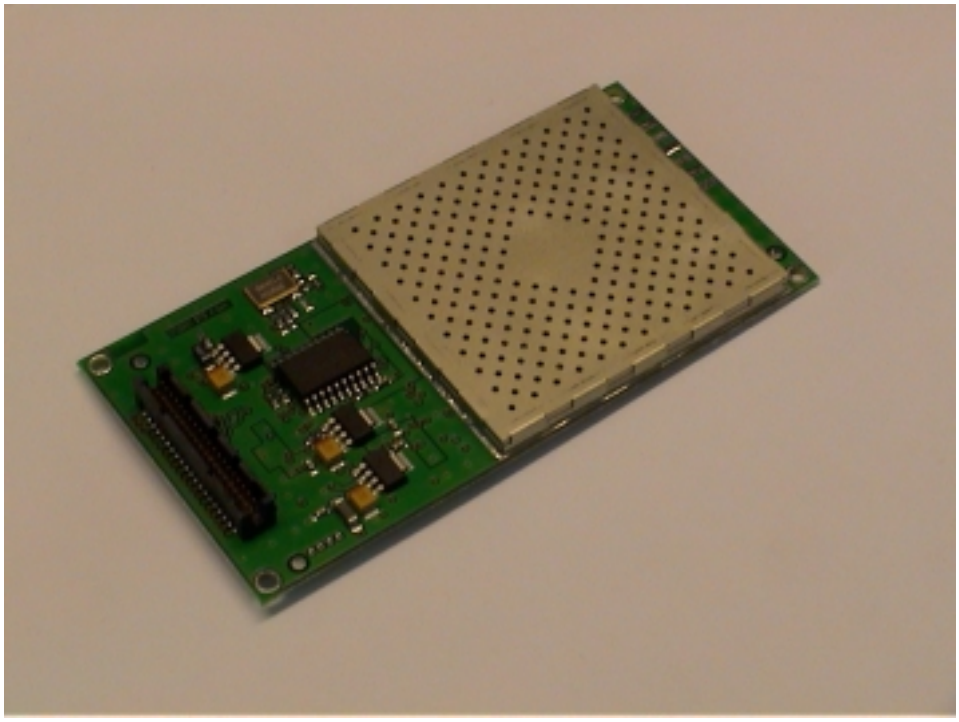
MAX RF Module



Technical Construction File

V0.7

ADCON RF Technology B.V.

Table of Contents

1 Introduction

The MAX module is a plug-in module for real-time data transception at 2.4GHz.
It comprises 16 RF channels. The air aggregate data rate is 611 kpbs. It utilises a dBPSK DSSS modulation scheme. Air framing, CRC checking and configuration of the RF components is handled by the module itself which leaves the communication to the board to which it interfaces limited to transception of messages.
This interface physically consists of a 40 pin connector to which the supply voltage is also connected. The module is without housing, because it is intended for integration in a customer defined final product. The PCB size is 100 x 50 mm. There is no antenna connector. There is a land pattern on the PCB instead to which a coaxial cable can be soldered to connect an external antenna.

This document describes the technical details of the MAX module. The following information is included:
- Technical specifications of the MAX module
- Description of hardware, including schematics and layout
- Short description of the software embedded in the MAX module

In the following text “customer” references to the manufacturer of the final product who incorporates the MAX modules into a final product.

This document is intended for radio approval authorities and laboratories.

2 Hardware

2.1 Specifications of MAX module

Parameter	Min.	Typ.	Max.	Unit	Condition
Overall					
Operating Frequency Range		2400 to 2483		MHz	
Channel Bandwidth			7	MHz	
RF channels		8			
Transmit mode		TDD/FDMA			Time domain duplex/Frequency domain multiple access
Modulation Method		QPSK			
Spread Spectrum Technique		DS			
Spreading		11bit barker			
Process gain		10.4		dB	
Aggregate data rate		611		kbps	
Operating Ambient Temp.		+10 to +50		°C	
RF Connection Type		Pigtail solder pads			
RF Impedance		50		Ω	
Interface Connector		40 pin, 1.27mm			40 pin BERG 87409-120 (male)
PCB Material		FR4			
PCB Size		100x50		mm	
Transmitter					
Tx Output Power	7.2	11.5	15.9	dBm	
Tx Spurious Outputs		ETSI compliant			
Carrier suppression		- 20		dBc	
Carrier Frequency Accuracy		+/- 25		ppm	Overall
Receiver					
RF Frequency Range		2400 to 2483		MHz	
IF Frequency		380		MHz	
Receive Sensitivity		-93		dBm	
Power Supply					
Supply Voltage Range	3.5	3.6	4	V	
Average power consumption		310	330	mA	Full operation
Average power consumption		140	170	mA	Receive only
Startup power consumption			800	mA	During max. 300ms
Air format					
Transmit/receive cycle		12,45833		ms	
Or cycles per second		80,26755853		s^{-1}	
Address range		16		Bits	
Datagram size		16		Bytes	
Error detection		16bit CRC			
Audio samples per subframe		25			
Error detection per subframe		16bit CRC			
Audio subframes per frame		12			

Audio quality					
Input signal					
Quantisation		16		bits	
Sample rate		24.000		ksps	
Interface		Serial			Conform PCM3500 specs, time slotted, master mode. Clock is provided by radio module
Compression		1:2			STS proprietary compression algorithm
Error suppression					Windowed repeat of last correct frame or mute
Sample rate bridging					Elegant sample skipping/inserting algorithm
Control interface					
Interface type		Async serial			
Baudrate		113.8		kbps	Can be used with 111.86kbps
Supporting signals		MIF BSY SRES			Message in FIFO Busy Serial Reset
Digital levels					
Vih	2.0			V	
Vil			0.8	V	
Voh	2.4			V	@Ioh=-24 mA
Vol			0.4	V	@Iol=24 mA

Settable channels:

0 2408.4MHz
1 2412.8MHz
2 2417.2MHz
3 2421.6MHz
4 2426.0MHz
5 2430.3MHz
6 2434.7MHz
7 2439.1MHz
10 2452.3MHz
11 2456.7MHz
12 2461.1MHz
13 2465.4MHz
14 2469.8MHz
15 2474.2MHz

Though the module permits the setting of 16 individual RF channels it is advisable to only select either the even or uneven channels to minimize the risk of modules interfering with each other. This reduces the number of useable RF channels to 8. The choice between the use of either the even or uneven channels should depend on the frequency location of possible interfering signals.

2.2 Technical Description of the Hardware

The following description refers to the schematics of the RF-PCB (see Appendix xxx) and to the included block diagram (see figure 1).

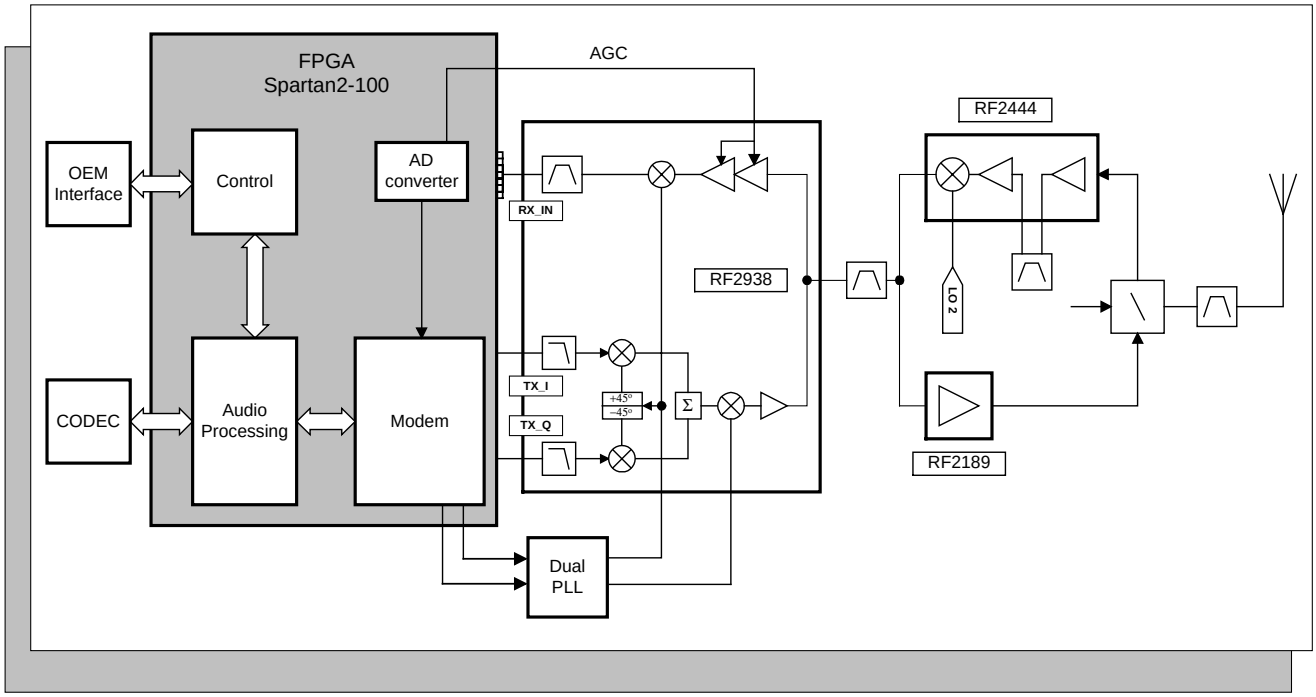


Figure 1. Block diagram of MAX module

Baseband Spread Spectrum

All baseband functionality is integrated in the Spartan2-100 FPGA. This device also provides the necessary signals to configure the RF chip set as well as the interface to the externally connected device (i.e. the device utilizing the MAX module as it's wireless interface).

Radio

The RF2938 (U1) is a 2.4GHz transceiver IC. It includes the modulator, demodulator, programmable low pass filters, the variable gain amplifier for reception and a driver stage for the PA, the RF2189. The IF frequency for receiving and transmitting is 380MHz. The SAW-filter SAW855771 from Sawtek (U4) is used to limit the bandwidth and to increase channel selectivity.
Low pass filter LFK30-05E2442LO84 (U13) and Bandpass filter DFC_22_LIGHT (U21) are used to reduce the bandwidth during transmission and receiving. An extra filter for receiving is band pass filter DFC_22_LIGHT (U22). During transmission the following two extra filters are used: DFC_22_LIGHT (U11,12). The AS169_73 (U3) is an RF-switch that is controlled by the FPGA to switch the RF signal path between reception and transmission.

Synthesizers
The Si4136 (U7) is a dual PLL that includes two VCOs for generation of the 2GHz RF LO-signal and the 2xIF = 760MHz IF LO-signal. The buffer amplifier around the BFR520 (Q2) provides isolation and some gain to get a proper power level at the RF2938 input. The reference signal for the PLL is supplied by the Rakon SXO110A TCXO (U6) operating at a frequency of 12.228MHz. The PLL is configured by the FPGA.

2.3 PCB information in appendices

The following PCB information can be found into the appendices:

Appendix A: Photographs of the MAX module
Appendix B: The schematic of the MAX module
Appendix C: Layout of the MAX module with the following information included:

- Layer 1
- Layer 2
- Layer 3
- Layer 4
- Drill

Appendix D: Silkscreen data of the MAX module
Appendix E: Bill Of Materials of the MAX module

2.4 Changing the antenna port configuration

To facilitate mounting of the MAX module in Base Station units, it is possible to change the antenna port configuration from a shared TX/RX port to separate TX and RX ports. To accomplish this, one resistor and one capacitor have to be rotated. See figure 2 for details.

Resistor R60 has to be rotated 90° so that it becomes resistor R69. Capacitor C67 has to be removed and on the position of R68 a 22pF 0603 capacitor must be placed.

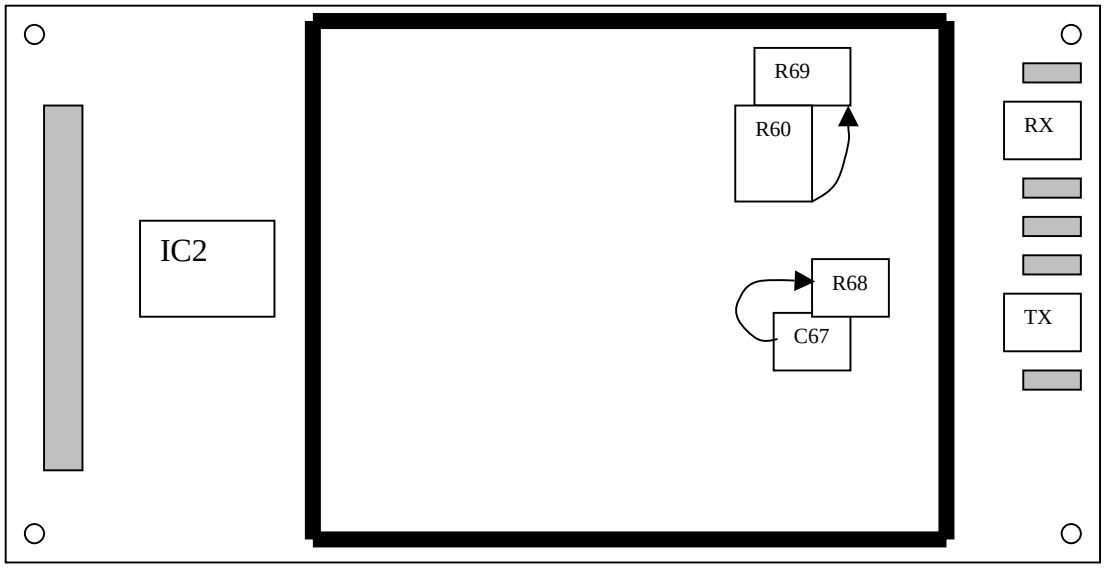

Figure 2. Changing antenna port configuration

3 Software

3.1 Short software description

The MAX module is intended to be used for real time audio transception (full duplex audio and data communication). Therefore it is able to interface to a Burr-Brown PCM3500 Codec. The audio sample rate is 24kHz. The system clock is therefore 12.288MHz (512 x 24kHz).

The radio modules support time domain duplex communication, meaning that there is a possibility for simultaneous flow of communication in both directions for audio and data at the same time.

3.1.1 Voice transmission

The audio that is transmitted is of "conference quality" (16 bit 24kHz sampling). This means that it is of a better quality than a voice connection as in telecommunications (300..3300 Hz) but typically less suited for hi-fi audio.
The audio signal is compressed by a factor of two to reduce the radio bandwidth.
Great care has been taken to ensure that no disturbances are put out at the receiver side when the signal is perturbed by interference. The likelihood of such a disturbance under normal operating conditions is assumed to be less than once in the lifetime of a unit.
On event of a perturbed audio sub frame, an effort is made to mask this or in case of longer interruptions, to mute the audio output.
Mismatch in clock frequencies of the base station and the table units is eliminated by an elegant remove/insert sample algorithm.

All of these algorithms have been demonstrated to and approved by the customer. For this purpose two CD's have been compiled with sound samples with the actual algorithms applied.

3.1.2 Control communication

Next to the audio transmission a control link is established. This control data is sent in the same frame as the audio data. The control link is addressable and broadcasts can be applied. Each airframe can convey 16 bytes of payload. The capacity of this link is approximately 10kbps. The address space is 16 bits, so a total of 65000 table units can be addressed.

3.2 Interface Description

In addition to real time audio transception, the MAX module offers addressable data communication facilities. All processing, audio compression and error detection, masking and muting is performed in the module.

The 40 pin BERG 87409-120, 1.27 mm pitch, connector supplies all other signals. A mating connector could be the BERG 87023-620 for a surface mount solution.

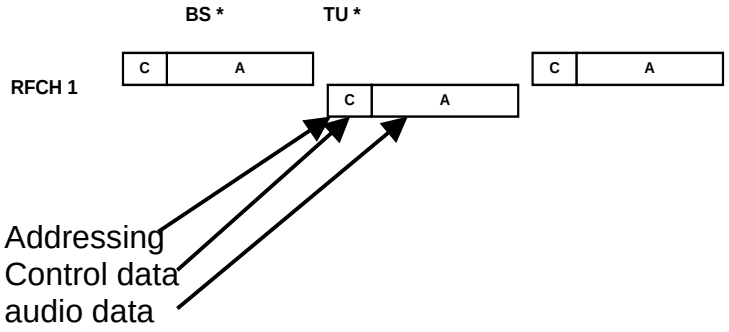
Pin	Name	Function	Remark
1.	VDD_RF	Power supply	Should be a clean and stable 3.6 v signal and should be able to deliver 800mA at startup.
2.	VDD_RF		
3.	VDD_RF		
4.	MCU_IN	Control output[1]	
5.	MCU_OUT	Control input[2]	
6.	BSY	Busy input	Holds of new messages on control output
7.	MIF	Message in FIFO	Signifies that a message is in the FIFO. This line gets asserted after the entire message is written into the module.
8.	SRES	Serial Reset	Resets the serial interface to a defined state
9.	FLASH_TDO	No user pin	Leave not connected
10.	DI	CODEC data out	
11.	DO	CODEC data in	
12.	FS	CODEC frame sync	CODEC output
13.	BCK	CODEC bit clock	CODEC output
14.	PD_CDC	CODEC power down	
15.	SCKIO	CODEC serial clock	CODEC input
16.	OSC_IN	TCXO input	12.288MHz +/-25ppm overall accuracy
17.	SOF(IN/OUT)	Frame synchronization	Base station only, input for slave, output for master.
18.	TXMUTE	Audio transmit disable	Only valid in table unit mode
19.	GPD	Global power down	Puts radio module in low power state
20.	FPGA_TMS	No user pin	Leave not connected
21.	FPGA_TCK	No user pin	Leave not connected
22.	FSO	CODEC frame sync	CODEC output
23.	HST_OUT	High speed output	Not implemented
24.	GND	Ground	
25.	HST_IN	High speed input	Not implemented
26.	GND	Ground	
27.	NC	Not connected	
28.	PD_REG_DIG	FPGA supply power down	Tie high normally. Ground pin to put module in zero power mode.
29.	/RESET	Reset FPGA	
30.	PD_FPGA	FPGA power down pin	Not supported yet. Tie high.
31.	FPGA_TDO	No user pin	Leave not connected
32.	FPGA_TDI	No user pin	Leave not connected
33.	FLASH_TCK	No user pin	Leave not connected
34.	FLASH_TMS	No user pin	Leave not connected

[1] To user micro controller
[2] From user micro controller

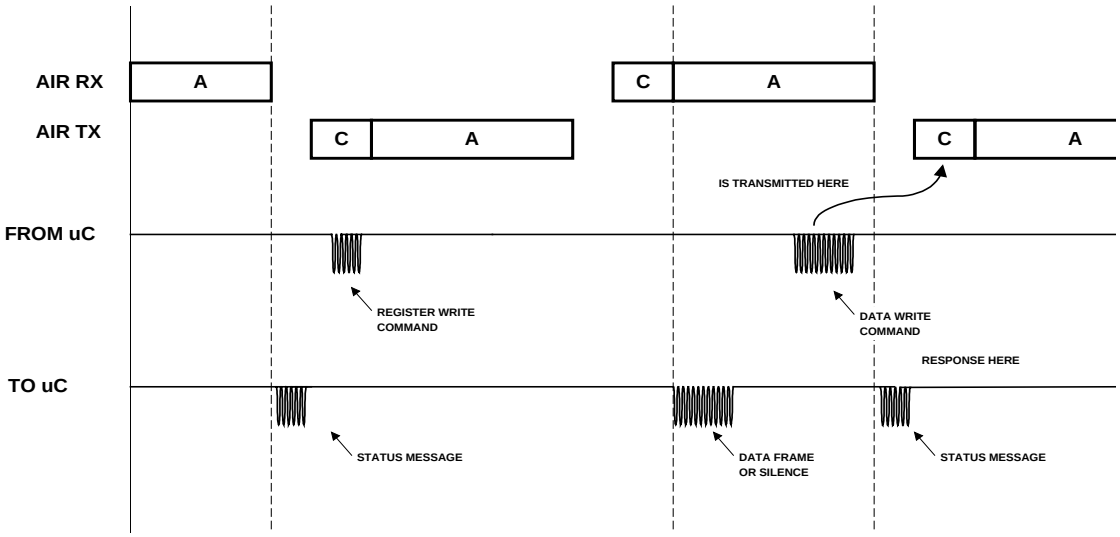
35.	FLASH_TDI	No user pin	Leave not connected
36.	GAIN_LNA	LNA gain select	Enables reduction of sensitivity
37.	HI_LOW_POWER	PA power select	Enables reduction of transmit power
38.	GND	Ground	A good clean ground signal should be supplied
39.	GND		
40.	GND		

3.3 Air timing

The radio modules use a Time Domain Duplex system to attain bi-directional communication. This processing is transparent to the user and it is of limited value to have knowledge about this. In some cases however to get the maximum performance of the system it is good to have some idea of system operation.



The airframes contain Addressing Control data and Audio data. These data packets are transmitted alternately by the base station and the table units. This is done in an interval of a little more than 12ms. In these 12ms a number of things happen on the control interface. This activity is depicted in the image below:



This section will discuss the different kinds of activity on the control interface in- and outputs. A detailed description of the messages will be given in the programming model chapter.

At the reception of each frame a message is sent to the user micro controller informing the latter about the quality of reception. In the base station this can be used as a criterion to switch to a different reception antenna. Besides the quality indicator room has been left to implement register reads. Right now there is no information inside the FPGA that can or is worth to be read.

A second message that is put out by the radio module is the Control Data message. This message is put out if the message validates for reception at that module. Validation will be done on whether a message received correctly, if the message is filled, if the address is correct or if a broadcast message is received.

At any time the user can take the initiative to send a control message to the radio module. This can be either a control data message or a command. Though the control data message can be fed to the radio module at any time, it is only transmitted at the airframe starting after message completion. This means that though a user can take a second to feed the message into the module, it will only be sent after it has been completed. A message can be cancelled by asserting the SRES line on the radio module.

To respond to a message received from the radio module the user has limited time to make sure that the reply is transmitted at the next message slot. A spreadsheet has been provided to calculate this available processing time with regard to the baud rate.

3.4 User interface

The MAX module interfaces to a customer specific control unit. The interface to the user is through the customer's hardware. Therefore every reference to the user interface is left to the manufacturer that incorporates the MAX module into a final product.
