

MIX 10 NG2 Operational Descriptions

The MIX 10 NG2 10-channel-stereo-mixing-system provides 6 microphone inputs and 4 switchable line inputs with a common master control as well as an additional sub group output. The microphone inputs can be selected as voice-controlled priority input. The selected microphone inputs fade in while any other source is gently faded out.

The MIX 10 NG2 can be operated via a standard serial RS 232 interface and the supplied software. The MIX 10 NG2 provides a separate treble/bass control and mute switch per microphone input. All signals can be routed via Dip switches on the rear to the master output or the sub group output. The sub group output can be controlled by the software as well. Each line input provides a separate volume control on the rear.
