## TEST REPORT

Report No. : AY0034265(9)

Date : 27 Jun 2019

### 1 General Information

#### 1.1 General Description

The equipment under test (EUT) model 85126 is a remote controlled toys. It operates at frequency band 49.86MHz for transmitter. The oscillation of radio control is generated by a 49.860MHz crystal (Y1) and modulated by encoder PT977. The EUT is powered by one 9V battery. The EUT contains two control levers to control moving direction and a ON/OFF switch (K1).

The wire antenna is used in EUT and the radio output power is unable to adjust.

Manufacturer declare that all Eleven models are the same cosmetics, materials, PCB layout, electrical, mechanical, physical design, including software/firmware; therefore model 85126 was provided to be the representative of the test sample.

The difference between the tested sample and declared model(s) are non-conductive outer casing only.

The PCB version of applicant's record is PCB B.

The brief circuit description is listed as follows:

## TEST REPORT

Report No. : AY0034265(9)

Date : 27 Jun 2019

### 2 Description of the radiated emission test

#### 2.1 Test Procedure

Radiated emissions measurements are investigated and taken pursuant to the procedures of ANSI C63.10 – 2013.

A non-conductive turntable with dimensions of 1.5m x 0.4m x 0.8m (L x W x H) placed above the reference ground plane. The equipment under test (EUT) was placed at 0.8m height for below 1GHz measurement and 1.5m height for above 1GHz measurement. The test distance is 3m between EUT and receiving antenna. A broadband antenna mounting on the mast received the signal strength. The turntable was rotated to maximize the emission level. The antenna was moving along the mast from 1m up to 4m until no more higher value was found. Both horizontal and vertical polarization of the antenna were placed and investigated. Additional absorbing material will be placed between the EUT and receiving antenna for above 1GHz measurement.

For below 30MHz, a loop antenna with its vertical plane is placed 3m from the EUT and rotated about its vertical axis for maximum response at each azimuth about the EUT. And the centre of the loop shall be 1 m above the ground.

The device was rotated through three orthogonal axes to determine which attitude and configuration produce the highest emission during measurement.

Date : 27 Jun 2019

### 2.3 Test Result

Peak Detector data was measured unless otherwise stated.

The radiated emissions are measured from 9kHz to 500MHz (the tenth harmonics)

The worst case configuration is shown on the worst case configuration of test setup photo.

The frequencies from fundamental up to tenth harmonics were investigated, and emissions more 20dB below limit were not reported. Thus, those highest emissions were presented in next pages.

The EUT has been tested in Transmission mode and antenna is fully extended.

It was found that the EUT meet the FCC requirement.

The Receiver (CAR) for this Transmitter (Remove) is under Supplier's Declaration of Conformity procedure.
