Exhibit H

Description of Operation
Xanboo/Core Technologies
XWS20T

The temperature sensor only sends a data packet if the temperature exceeds or falls below a set temperature. This is used for detecting heating or freezing conditions in general. It does not report temperature. The Sensor has a deep sleep mode and does not have a "Keep Alive" packet. During the **Alarm** condition or **Low Battery** condition, the unit transmits a 19 ms packet every 15 minutes.
