Architecture

XANBOO's siren accessory enables you to signal an audible alert to an event being monitored. If, for example, you are monitoring an area for motion and this is detected, the siren can be configured to sound when the area event takes place.

The hardware architecture is shown in Figure 1.

1. Two way telemetry link to support XANBOO AFM2 functionality.
2. Corded design removes the need for external power supply.
3. LED indicates state of available power to device.
4. Discovery button.
5. Sound level 105dB.
6. Typical range outdoors: 250 feet.
7. Typical range indoors: 60 feet.
8. Transmits on 418MHz frequency.
7. Input: 120V 60Hz AC
