## SECTION 2: Equipment under test (E.U.T.)

### 2.1 Identification of E.U.T.

| Type of Equipment | $:$ | Push Start Switch |
| :--- | :--- | :--- |
| Model No. | $:$ | $37290-54$ P0 |
| Serial No. | $:$ | Refer to Clause 4.2 |
| Rating | $:$ | DC 12.0 V |
| Receipt Date of Sample | Chis and August 3, 2018 |  |
| Country of Mass-production | $:$ | China |
| Condition of EUT | $:$ | Production model |

### 2.2 Product Description

Model: 37290-54P0 (referred to as the EUT in this report) is a Push Start Switch.

## Radio Specification

Radio Type : Transceiver
Frequency of Operation : 125 kHz
Modulation
ASK
Antenna type
Clock Frequency (maximum)
Coil Antenna (built-in)
: 8 MHz
*Model No. 37290-79M0 and Model No. 37290-54P0 have the same circuit and parts; except for colors of LED.
Thus they are completely identical in Radio and EMC characteristics.
The test was performed with Model No.37290-79M0 (FCC ID: OUCP79M0) as representative, and the spot-check test was performed with Model No.37290-54P0.

## FCC 15.31 (e)

This EUT provides stable voltage constantly to RF Module regardless of input voltage. Therefore, this EUT complies with the requirement.

## FCC Part 15.203 Antenna requirement

It is impossible for end users to replace the antenna, because the antenna is mounted inside of the EUT. Therefore, the equipment complies with the antenna requirement of Section 15.203.

## SECTION 5: Radiated emission (Fundamental and Spurious Emission)

## Test Procedure

EUT was placed on a urethane platform of nominal size, 1.0 m by 1.5 m , raised 0.8 m above the conducting ground plane.
The Radiated Electric Field Strength has been measured in a Semi Anechoic Chamber with a ground plane.
Frequency: From 9 kHz to 30 MHz
The EUT was rotated a full revolution in order to obtain the maximum value of the electric field intensity. The measurements were performed for vertical polarization (antenna angle: 0 deg., 45 deg., 90 deg., and 135 deg.) and horizontal polarization.
*Refer to Figure 1 about Direction of the Loop Antenna.
Frequency: From 30 MHz to 1 GHz
The measuring antenna height varied between 1 and 4 m and EUT was rotated a full revolution in order to obtain the maximum value of the electric field intensity.
The measurements were performed for both vertical and horizontal antenna polarization.
The test was made with the detector (RBW / VBW) in the following table.
When using Spectrum analyzer, the test was made with adjusting span to zero by using peak hold.
Test Antennas are used as below;

| Frequency | Below 30 MHz |  | 30 MHz to 200 MHz | 200 MHz to 1 GHz |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Antenna Type | Loop |  | Biconical | Logperiodic |  |
| Frequency | ```From 9 kHz to 90 kHz and From 110 kHz to 150 kHz``` | From 90 kHz to 110 kHz | $\begin{gathered} \text { From } 150 \mathrm{kHz} \text { to } \\ 490 \mathrm{kHz} \end{gathered}$ | From 490 kHz to 30 MHz | From 30 MHz to <br> 1 GHz |
| Instrument used | Test Receiver |  |  |  |  |
| Detector | PK / AV | QP | PK / AV | QP | QP |
| IF Bandwidth | 200 Hz | 200 Hz | 9 kHz | 9 kHz | 120 kHz |
| Test Distance | $3 \mathrm{~m} * 1)$ | $3 \mathrm{~m} * 1)$ | $3 \mathrm{~m} * 1)$ | $3 \mathrm{~m} * 2)$ | 3 m |

*1) Distance Factor: $40 \times \log (3 \mathrm{~m} / 300 \mathrm{~m})=-80 \mathrm{~dB}$
*2) Distance Factor: $40 \times \log (3 \mathrm{~m} / 30 \mathrm{~m})=-40 \mathrm{~dB}$
Although these tests were performed other than open field test site, adequate comparison measurements were confirmed against 30 m open field test site. Therefore sufficient tests were made to demonstrate that the alternative site produces results that correlate with the ones of tests made in an open field based on KDB 414788.

These tests were performed in semi anechoic chamber. Therefore the measured level of emissions may be higher than if measurements were made without a ground plane.
However test results were confirmed to pass against standard limit.

- The carrier level and noise levels were confirmed at each position of $\mathrm{X}, \mathrm{Y}$ and Z axes of EUT to see the position of maximum noise, and the test was made at the position that has the maximum noise.

This EUT has two modes which transponder key is inserted or not. The worst case was confirmed with and without transponder key, as a result, the test without transponder key was the worst case. Therefore the test without transponder key was performed only.

The test results and limit are rounded off to one decimal place, so some differences might be observed.

*Hyphens for Last Calibration Date, Calibration Due Date and Cal Int (month) are instruments that Calibration is not required (e.g. software), or instruments checked in advance before use.

The expiration date of the calibration is the end of the expired month.
All equipment is calibrated with valid calibrations. Each measurement data is traceable to the national or international standards.

As for some calibrations performed after the tested dates, those test equipment have been controlled by means of an unbroken chains of calibrations.
