I, the undersigned, hereby declare that the equipment tested and referenced in this report conforms to the identified standard(s) as described in this test report. No modifications were made to the equipment during testing in order to achieve compliance with these standards. Furthermore, there was no deviation from, additions to, or exclusions from, the applicable parts of FCC Part 2, FCC Part 15, Industry Canada RSS-247, RSS-Gen, and ANSI C63.10.

Suite 1400  
Herndon, VA 20170  
<http://www.rheintech.com>

Client: Harris Corporation  
Model: XG-25P Portable Radio  
IDs: OWDTR-0140-E/3636B-0140  
Standards: FCC 15.247/IC RSS-247  
Report #: 2015076DSS

## 1 General Information

### 1.1 Scope

This is an original FCC and Industry Canada certification application report.

Applicable Standards:

- FCC Rules Part 15.247: Frequency Hopping, Direct Spread Spectrum and Hybrid Systems that are in operation within the bands of 902-928 MHz, 2400-2483.5 MHz and 5725-5850 MHz
- RSS-247 Issue 1: Digital Transmission Systems (DTSs), Frequency Hopping Systems (FHSS) and License Exempt Local Area Network (LE-LAN) Devices

### 1.2 Description of EUT

<b>Equipment Under Test</b>	XG-25P Portable Radio
<b>Power Supply</b>	Internal radio battery operated
<b>Modulation Type</b>	FHSS
<b>Frequency Range</b>	2402 – 2480 MHz
<b>Antenna Connector Type</b>	N/A
<b>Antenna Type</b>	Internal chip

### 1.3 Test Facility

The open area test site and conducted measurement facility used to collect the radiated data is located at 360 Herndon Parkway, Suite 1400, Herndon, Virginia 20170. This site has been fully described in a report and approved by the Federal Communications Commission to perform AC line conducted and radiated emissions testing.

### 1.4 Related Submittal(s)/Grant(s)

This is an original application. Harris will be seeking IC family certification for two model numbers, DPXG-PF78B-e1 (System) and DPXG-PB78B-e1 (Scan).

### 1.5 Modifications

None.

Rhein Tech Laboratories, Inc.  
360 Herndon Parkway  
Suite 1400  
Herndon, VA 20170  
<http://www.rheintech.com>

Client: Harris Corporation

Standards: FCC 15.247/IC RSS-247  
Report #: 2015076DSS

## 2 Test Information

### 2.1 Description of Test Modes

In accordance with FCC 15.31(m), and because the EUT utilizes an operating band greater than 10 MHz, the following frequencies were tested:

**Table 2-1: Channels Tested**

Channel	Frequency
Low	2402
Middle	2441
High	2480

### 2.2 Exercising the EUT

The EUT was supplied with test software to select various transmit/receive modes (for example, high, mid, and low channel, hopping on/off, etc.) for testing, and to continuously transmit during testing. The carrier was also checked to verify that information was being transmitted. There were no deviations from the test standard(s) and/or methods. The test results reported relate only to the item tested.

GFSK, 2-EDR and 3-EDR modes were investigated. Where pertinent, data is presented for the three modes; otherwise, worst-case data is presented. GFSK was found to be worst case for radiated measurements, data for it is presented.

### 2.3 Test Result Summary

**Table 2-2: Test Result Summary – FCC Part 15, Subpart C (Section 15.247) / IC RSS-247**

Test	FCC Reference	IC Reference	Result
AC Power Conducted Emissions	FCC 15.207	RSS-Gen 8.8	N/A
Radiated Emissions	FCC 15.209	RSS-247 5.5; RSS-Gen 6.13/7.1	Pass
Maximum Peak Power Output	FCC 15.247(b)(1)	RSS-247 5.4(2), RSS-Gen 6.12	Pass
Antenna Conducted Spurious Emissions	FCC 15.247(d)	RSS-247 5.5, RSS-Gen 6.13	Pass
Carrier Frequency Separation	FCC 15.247(a)(1)	RSS-247 5.1(2)	Pass
Band Edge Measurement	FCC 15.247(d)	RSS-247 5.5	Pass
20 dB Bandwidth	FCC 15.247(a)(1)(ii)	RSS-247 5.1(1)	Pass
Hopping Characteristics	FCC 15.247(a)(1)(iii)	IC RSS-247 5.1(4)	Pass
Average Time of Occupancy	FCC 15.247(a)(1)(iii)	IC RSS-247 5.1(4)	Pass

## 2.4 Tested System Details

The test sample was received on February 11, 2016. Listed below are the identifiers and descriptions of all equipment, cables, and internal devices used with the EUT for this test, as applicable.

The EUT includes a System model and a Scan model, the difference being that the System model has a DTMF keypad. The System model is considered to be representative of the radio family and to have the worst case emissions, and was therefore used for testing.

The device was programmed for multiple modes of operation and modulation types.

## 5 Antenna Conducted Spurious Emissions – FCC 15.247(d), RSS-247 5.5

Procedure: C63.10-2013 6.7

No conducted spurious emissions were within 20 dB of the limit, therefore no data is reported.

**Table 5-1: Antenna Conducted Spurious Emissions Test Equipment**

## 6 Band-Edge Compliance of RF Conducted Emissions – FCC 15.247(d), RSS-247 5.5

### 6.1 Band Edge Test Procedure

Procedure: C63.10-2013 6.10

The EUT was connected to the spectrum analyzer through suitable attenuation. The span was set wide enough to capture the peak level of the emission operating on the channel closest to the band edge, as well as any modulation products which fall outside of the authorized band of operation. The spectrum analyzer was set to the following:

RBW > = 1 % of span

VBW > = RBW

Sweep = auto

Detector function = peak

Trace = max hold

The trace was allowed to stabilize. The marker was set on the emission at the band edge. The marker-delta was used to show the delta between the maximum in-band emission and the emission at the band edge, and was compared to the 20 dBc requirement of 15.247(d) (when using peak emissions). This measurement was taken in both fixed frequency and hopping modes.

## 8 Carrier Frequency Separation - 15.247(a)(1), RSS-247 5.1(2)

### 8.1 Carrier Frequency Separation Test Procedure

Procedure: C63.10-2013 7.8.2

Frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25 kHz, or the 20 dB bandwidth of the hopping channel, whichever is greater. Alternatively, frequency hopping systems operating in the 2400–2483.5 MHz band may have hopping channel carrier frequencies that are separated by 25 kHz or two-thirds of the 20 dB bandwidth of greater, provided the systems operate with an output power no greater than 125 mW.

Measured frequency separation = 1.0 MHz

### 8.2 Carrier Frequency Separation Test Data

Plot 8-1: Carrier Frequency Separation

## 9 Hopping Characteristics – FCC 15.247(a)(1)(iii), RSS-247 5.1(4)

### 9.1 Hopping Characteristics Test Procedure

Procedure: C63.10-2013 7.8.3

Frequency hopping systems in the 2400–2483.5 MHz band shall use at least 15 channels. The average time of occupancy on any channel shall not be greater than 0.4 seconds within a period of 0.4 seconds multiplied by the number of hopping channels employed. Frequency hopping systems may avoid or suppress transmissions on a particular hopping frequency provided that a minimum of 15 channels are used.

### 9.2 Number of Hopping Frequencies

Measured number of hopping frequencies = 79

**Plot 9-1: Number of Hopping Frequencies (2402 - 2480 MHz)**

### 9.3 Average Time of Occupancy

Procedure: C63.10-2013 7.8.4

The average time of occupancy on any channel shall not be greater than 0.4 seconds within a period of 0.4 seconds multiplied by the number of hopping channels employed.

Allowed period = 0.4 s X 79 channels = 31.6 s

Pulse width = 2.86 ms

Number of pulses within a 31.6 s sweep = 32

Average time of occupancy in 31.6 s = 2.86 ms X 32 pulses = 0.092 s, which meets the limit of 0.4 s

**Plot 9-2: Time of Occupancy (Dwell Time)**

## 10 Radiated Emissions Test Results - FCC Rules and Regulations Part 15.247(d); RSS-247 2.2

### 10.1 Limits of Radiated Emissions Measurement

Frequency (MHz)	Field Strength (uV/m)	Measurement Distance (m)
0.009-0.490	2400/f (kHz)	300
0.490-1.705	2400/f (kHz)	30
1.705-30.0	30	30
30-88	100	3
88-216	150	3
216-960	200	3
Above 960	500	3

As shown in 15.35(b), for frequencies above 1000 MHz, the field strength limits are based on average detector, however, the peak field strength of any emission shall not exceed the maximum permitted average limits, specified above by more than 20 dB under any circumstances of modulation.

### 10.2 Radiated Emissions Measurement Test Procedure

Before final measurements of radiated emissions were made on the open-field three/ten meter range, the EUT was scanned indoors at one and three meter distances. This was done in order to determine its emissions spectrum signature. The physical arrangement of the test system and associated cabling was varied in order to determine the effect on the EUT's emissions in amplitude, direction and frequency. This process was repeated during final radiated emissions measurements on the open-field range, at each frequency, in order to ensure that maximum emission amplitudes were attained.

Final radiated emissions measurements were made on the three/ten-meter, open-field test site. The EUT was placed on a nonconductive turntable 0.8 meters above the ground plane. The spectrum was examined from 9 kHz to the 10<sup>th</sup> harmonic of the highest fundamental transmitter frequency (24.8 GHz).

At each frequency, the EUT was rotated 360°, and the antenna was raised and lowered from 1 to 4 meters in order to determine the emission's maximum level. Measurements were taken using both horizontal and vertical antenna polarizations. For frequencies between 30 and 1000 MHz, the spectrum analyzer's 6 dB bandwidth was set to 120 kHz, and the analyzer was operated in the CISPR quasi-peak detection mode. For emissions above 1000 MHz, emissions are measured using the average detector function with a minimum resolution bandwidth of 1 MHz. No video filter less than 10 times the resolution bandwidth was used. The highest emission amplitudes relative to the appropriate limit were measured and recorded in this report.

### 10.3 Radiated Emissions Harmonics/Spurious Test Data

**Table 10-1: Radiated Emissions Harmonics/Spurious - 2402 MHz - Average**

Emission Frequency (MHz)	Calculated Average (dBuV) Peak – 47.6 duty cycle correction	Site Correction Factor (dB/m)	Average Emission Level (dBuV/m)	Average Limit (dBuV/m)	Average Margin (dB)

**11 Conclusion**

The data in this measurement report shows that the **Harris Corporation Model XG-25P 700/800 MHz, FCC ID: OWDTR-0140-E, IC: 3636B-0140**, complies with the applicable requirements of FCC Part 15 and Part 2, and IC RSS-247.
