General Product Information

Product Function and Intended Use

The equipment under test (EUT) is a transmitter for a RC toy operating at 27.145 MHz. The EUT has two control rods for commanding the forward, backward, left and right movement of the associated receiver.

FCCID: OYK-TX027145-1103

Independent Operation Modes

The basic operation modes are:

- transmitting control signal for the RC toy Car.

For further information refer to User Manual

Submitted Documents

The submitted documents are listed as follow:

- Circuit diagram
- Block diagram
- User manual
- Label artwork

Related Submittal(s) Grants

This is a single application for certification of the transmitter.

Test Set-up and Operation Mode

Principle of Configuration Selection

Emission: The equipment under test (EUT) was configured to measure its highest possible radiation level. The test modes were adapted accordingly in reference to the instructions for use.

Test Operation and Test Software

Test operation should refer to test methodology.

- There was no special software to exercise the device.

Special Accessories and Auxiliary Equipment

The product has been tested together with the following additional accessories:

- none

Countermeasures to achieve EMC Compliance

- none

Test Methodology

Radiated Emission

The radiated emission measurements were performed according to the procedures in ANSI C63.4-2003.

The equipment under test (EUT) was placed at the middle of the 80 cm height turntable, and the turntable is 3 meters far from the measuring antenna. During the testing, the EUT was operated standalone and arranged for maximum emissions. The EUT was tested in three orthogonal planes.

The investigation is performed with the EUT rotated 360°, the antenna height scanned between 1m and 4m, and the antenna rotated to repeat the measurements for both the horizontal and vertical antenna polarizations. Repeat the measurement steps until the maximum emissions were obtained.

All radiated tests were performed at an antenna to EUT with 3 meters distance, unless stated otherwise in particular parts of this test report.

Field Strength Calculation

The field strength at 3 m was established by adding the meter reading of the spectrum analyzer to the factors associated with antenna correction factor, cable loss, preamplifiers and filter attenuation.

The equation is expressed as follow:

FS = R + AF + CF + FA - PA

Where FS = Field Strength in dBuV/m at 3 meters.

- R = Reading of Spectrum Analyzer in dBuV.
- AF = Antenna Factor in dB.
- CF = Cable Attenuation Factor in dB.
- FA = Filter Attenuation Factor in dB.
- PA = Preamplifier Factor in dB.

FA and PA are only be used for the measuring frequency above 1 GHz.

Test Results

Radiated Emission of Carrier Frequency

RESULT:

Subclause 15.227(a)

Pass

| Test Specification | : | FCC Part 15 Subclause 15.227(a) |
|----------------------|---|---------------------------------|
| Test Method | : | ANSI 63.4-2003 |
| Measurement Location | : | Semi Anechoic Chamber |
| Measurement Distance | : | 3m |
| Detector Function | : | Peak and Average |
| Measurement BW | : | 120 kHz |
| Supply Voltage | : | DC 9V |

Polarization: Vertical

| Detector function | Frequency | Measured Field strength at 3m | Delta to Limit |
|-------------------|-----------|----------------------------------|----------------|
| | (MHz) | (dBµV/m) | (dB) |
| Peak | 27.145 | 69 | -31 |
| Average | 27.145 | 49.9 | -30.1 |

Polarization: Horizontal

| Detector function | Frequency (MHz) | Measured Field strength at 3m (dBμV/m) | Delta to Limit (dB) |
|-------------------|--------------------|--|------------------------|
| Peak | 27.145 | 45 | -55 |
| Average | 27.145 | 26 | -54 |

| Limit Subclause 15.227 | | | | | |
|---------------------------|---------------|--------|------------------|--------|--|
| Frequency within the band | Peak Emission | | Average Emission | | |
| Frequency within the band | (µV/m) | dBµV/m | (µV/m) | dBµV/m | |
| 26.96-27.28 MHz | 100,000 | 100.0 | 10,000 | 80.0 | |

According to section 15.35(b), when average radiated emission measurements are specified in this part, including average emission measurements below 1000 MHz, there also is a limit on the peak level of the radio frequency emissions. Unless otherwise specified, the limit on peak radio frequency emissions is 20 dB above the maximum permitted average emission limit applicable to the equipment under test.

Spurious Radiated Emissions

Subclause 15.227(b)

| *271.455 | 14.5 | 46.0 | -32.8 |

Remark: (1) '*' indicates the frequency of the emissions fall into the restricted band as defined in Section 15.205(a). They comply with the radiated emission limits specified in Section 15.209.

(2) There is no spurious emission found between lowest oscillating frequency to 30 MHz.

Limit

Subclause 15.209

Radiated emissions, which fall in the restricted bands, as defined in Section 15.205(a), must also comply with the radiated emission limits specified in Section 15.209.

| Limit for | Radiated | Emission | under | Section | 15 209. |
|-----------|-----------|----------|-------|---------|---------|
| | riaulateu | | unuer | Section | 10.200. |

| Frequency (MHz) | Field strength (µV/m) | Field strength (dBµV/m) | Measurement distance (m) |
|--------------------|--------------------------|----------------------------|-----------------------------|
| 30-88 | 100 | $20*\log(100) = 40.0$ | 3 |
| 88-216 | 150 | $20*\log(150) = 43.5$ | 3 |
| 216-960 | 200 | $20*\log(200) = 46.0$ | 3 |
| 960-2500 | 500 | $20*\log(500) = 54.0$ | 3 |

The emission limits shown in the above table are based on measurements employing a CISPR quasi-peak detector and above 1000 MHz are based on the measurements employing an average detector.
