Power Tuning Procedure for the TUNet NC-2202 Network Controller (OZFN2202).

The output power of the transmitter card that serves as a pre-driver to the power amplifier is calibrated during production test. The final output of the Network Controller is also calibrated and the input power required to drive it is determined and limited for an output power range between 19 Watts and 52 Watts. No tuning is required to the power amplifier to operate within this power range.

Sincerely,

Mark Fairburn
RF Design Engineer
