## **SECTION 4: Operation of E.U.T. during testing**

### **4.1 Operating Modes**

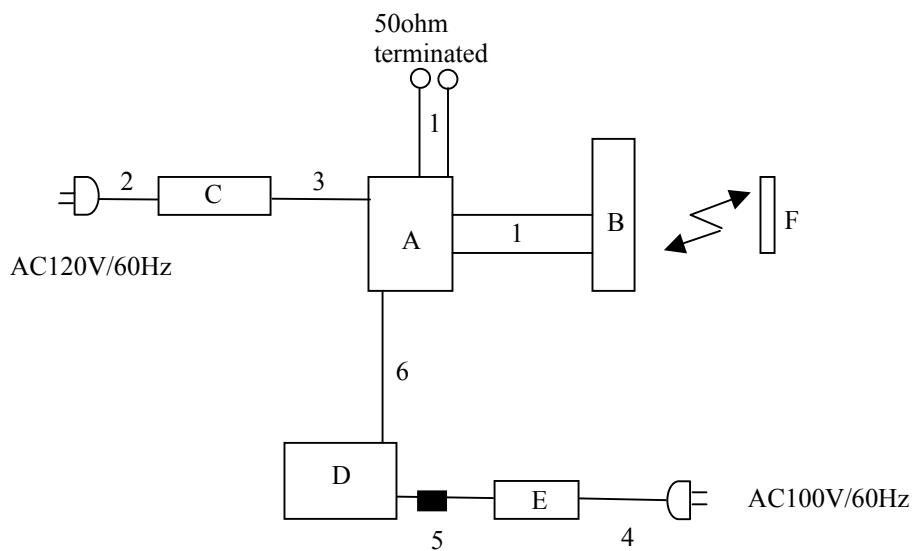

The mode is used :      Transmitting mode  
 Low Channel(ch1)      :902.726MHz  
 Mid Channel(ch25)      :914.773MHz  
 High channel(ch50)      :927.322MHz  
 Max output mode (30dBm)  
 \*This equipment can be set up to maximum output power by software according to user manual.  
 But this sample could only set up 29.2dBm for the maximum power.  
 This value can be accepted for FCC tolerance.

### **4.2 Configuration and peripherals**

\*Cabling was taken into consideration and test data was taken under worse case conditions.

\*According to the specification, there is no simultaneous transmitting and receiving mode even if all ports(4 ports) are filled(for transmitting and receiving from time division). Therefore, the test was made with one antenna, and others ports were connected to cables or terminated in 50 ohm.

\*As for the noise level for the channel of middle and high in Radiated Spurious emission, they are equal level to the one of channel low. Therefore, the test was made with the point that has small margin.

## **SECTION 5: Conducted Emission**

### **Test Procedure and conditions**

EUT was placed on a platform of nominal size, 1m by 0.5m, raised 80cm above the conducting ground plane. The rear of tabletop was located 40cm to the vertical conducting plane. The rear of EUT, including peripherals aligned and flushed with rear of tabletop. All other surfaces of tabletop were at least 80cm from any other grounded conducting surface. EUT was located 80cm from a Line Impedance Stabilization Network (LISN)/ Artificial mains Network (AMN) and excess AC cable was bundled in center.

#### 1) For the tests on EUT with other peripherals (as a whole system)

I/O cable and AC cables that were connected to the peripherals were bundled in center. They were folded back and forth forming a bundle 30cm to 40cm long and were hanged at a 40cm height to the ground plane.

The AC Mains Terminal Continuous disturbance Voltage has been measured with the EUT in a Semi Anechoic Chamber or a Measurement Room.

The EUT was connected to a LISN (AMN).

An overview sweep with peak detection has been performed.

[Conducted]

### **Test Procedure**

The Out of Band Emission was measured with a spectrum analyzer connected to the antenna port.

Test data	: APPENDIX 3

[Radiated]

### **Test Procedure**

EUT was placed on a platform of nominal size, 1.0m by 0.5m, raised 80cm above the conducting ground plane. The Radiated Electric Field Strength intensity has been measured in a Semi Anechoic Chamber with a ground plane and at a distance of 3m(Below 10GHz).

The height of the measuring varied between 1 and 4m and EUT was rotated a full revolution in order to obtain the maximum value of the electric field intensity.

The measurements were performed for both vertical and horizontal antenna polarization with the Test Receiver or the Spectrum Analyzer.

In any 100kHz bandwidth outside the frequency band in which the spread spectrum intentional radiator is operating, the radio frequency power that is produced by the intentional radiator confirmed 20dB below that in the 100kHz bandwidth within the band that contains the highest level of the desired power, based on a radiated measurement.

Test data	: APPENDIX 3
Test result	: Pass

**20dBc was applied to the frequency over the limit of FCC 15.209 and outside the restricted band of 15.205.**

Frequency	Below 1GHz	Above 1GHz

Sample Calculation :

RESULT=Reading + ANT Factor - Amp Gain + Cable Loss + High Pass Filter (or Att)

\*Except for the above table : All other spurious emissions were less than 20dB for the limit.

Used Equipment: MHA-06, MCC-04, MCC-10, MCC-25, MPA-01, MHF-03, MHF-04, MRENT-09

\* The result is rounded off to the second decimal place. Therefore, there may be 0.1 difference for the result.

\* In the above table, factor 0.0dB represents no use of Atten. and/or Filter.

20dBc was applied to the frequency over the limit of FCC 15.209 and outside the restricted band of 15.205.
