300-1500			f/1500	30			
1500-100,000			1.0	30			

f = Frequency in MHz ; \*Plane-wave equivalent power density

## 2.2 MPE Calculation Formula

## $Pd = (Pout^{*}G) / (4^{*}pi^{*}r^{2})$

### where

 $Pd = power density in mW/cm^2$ 

Pout = output power to antenna in mW

G = gain of antenna in linear scale

Pi = 3.1416

R = distance between observation point and center of the radiator in cm

#### 2.3 Classification

The antenna of this product, under normal use condition, is at least 20cm away from the body of the user. So, this device is classified as **Mobile Device**.

#### 2.5 Calculation Result Of Maximum Conducted Power

2.4GHz Directional gain = 3.2dBi +  $10\log(2) = 6.21$ dBi

Note:

- 2. 2.4GHz & 5GHz WLAN technologies cannot transmit at same time. WCDMA & LTE technologies cannot transmit at same time. WLAN, WWAN, Bluetooth, Zigbee & Z-Wave technologies can transmit at same time.
- 3. This report is prepared for FCC class II permissive change. This report is issued as a supplementary report to BV CPS report no. SA200709D02. The difference compared with original report is listed as below. Due to the same Conducted power of EUT and we didn't re-calculated MPE value. ♦ Adding new HW, Buzzer, Tamper & Pairing button

♦ Cancel the large shell of the original report.

<sup>1.</sup> Determining compliance based on the results of the compliance measurement, not taking into account measurement instrumentation uncertainty.

<sup>♦</sup> Adding new battery source (Main source: Simpo: Model: Sercomm NA50X\_NA502S, 2nd source: FUJI: Model: IG55)

# **Conclusion:**

The formula of calculated the MPE is: CPD1 / LPD1 + CPD2 / LPD2 + .....etc. < 1 CPD = Calculation power density LPD = Limit of power density

WLAN 2.4GHz + Zigbee + BT EDR + Z-Wave + WCDMA Band 5 =0.2470/1 + 0.0244/1 + 0.0016/1 + 0.0000013/0.61 + 0.0758106/0.55= 0.41084

Therefore the maximum calculations of above situations are less than the "1" limit.
