Calculation

Given $E = \frac{\sqrt{30 \times P \times G}}{d}$ & $S = \frac{E^2}{3770}$

Where *E = Field strength in Volts / meter*
P = Power in Watts
G = Numeric antenna gain
d = Distance in meters
S = Power density in milliwatts / square centimeter

Combining equations and re-arranging the terms to express the distance as a function of the remaining variables yields:

$$S = \frac{30 \times P \times G}{3770 d^2}$$

Changing to units of mW and cm, using:

P (mW) = P (W) / 1000 and

d (cm) = d(m) / 100

Yields

$$S = \frac{30 \times (P/1000) \times G}{3770 \times (d/100)^2} = 0.0796 \times \frac{P \times G}{d^2}$$ ***Equation 1***

Where *d = Distance in cm*
P = Power in mW
G = Numeric antenna gain
S = Power density in mW / cm^2

Maximum Permissible Exposure

Substituting the MPE safe distance using d = 20 cm into Equation 1:

Yields

$$S = 0.000199 \times P \times G$$

Where *P = Power in mW*
G = Numeric antenna gain
S = Power density in mW / cm^2

IEEE 802.11b mode:

EUT output power = 122.462 mW

Numeric Antenna gain = 2.26

→ *Power density = 0.055076 mW / cm^2*

IEEE 802.11g mode:

EUT output power = 273.527 mW

Numeric Antenna gain = 2.26

→ *Power density = 0.123016 mW / cm^2*

IEEE 802.11n HT 20 MHz mode:

EUT output power = 130.036 mW

Numeric Antenna gain = 4.13

→ *Power density = 0.106873 mW / cm^2*

IEEE 802.11n HT 40 MHz mode:

EUT output power = 376.906 mW

Numeric Antenna gain = 4.13

→ *Power density = 0.309768 mW / cm^2*

(For mobile or fixed location transmitters, the maximum power density is 1.0 mW/cm^2 even if the calculation indicates that the power density would be larger.)
