### 1.1. Test Result of RF Exposure Evaluation

. Product: Wireless_N PCI adaptor
. Test Item: RF Exposure Evaluation Data
. Test site: OATSI-SD
. Test Mode: Normal Operation

### 1.1.1. Antenna Gain

The maximum Gain is 2.0 dBi .

### 1.1.2. EUT Operation condition

Software provided by client enabled the EUT to transmit and receive data at lowest, middle and highest channel individually.

The MPE is calculated as $0.016 \mathrm{~mW} / \mathrm{cm}^{2}$ < limit $1 \mathrm{~mW} / \mathrm{cm}^{2}$. So, RF exposure limit warning or SAR test are not required.

For $2412-2462 \mathrm{MHz}$, the EUT will only be used with a separation of 20 cm or greater between the antenna and nearby persons and can therefore be considered a mobile transmitter per 47CFR2. 1091 (b).

The RF Exposure Information page from the manual is included here for reference.
