

March 4, 2002

Mr. Steven Makk
Stephen Makk & Associates, Inc.
1015 Conyers Executive Park, Suite 200
Conyers, GA 30012

Dear Mr. Makk:

Enclosed please find Signal Golf International Pte. Ltd. file copy of the Part 15 Certification Application for the Smartpin Transmitter.

Signal Golf International Pte. Ltd. should expect to receive a certification grant for this product within the next 1-2 weeks.

If you have any questions, please don't hesitate to call. Thank you for your business.

Sincerely,

A handwritten signature in dark ink, appearing to read 'Timothy R. Johnson', is placed above the typed name.

Timothy R. Johnson
NARTE Certified EMC Engineer
No. EMC-002205-NE

MEASUREMENT/TECHNICAL REPORT

COMPANY NAME: **Signal Golf International Pte. Ltd.**

MODEL: **Smartpin**

FCC ID: **P2T010417-0D**

DATE: **March 4, 2002**

This report concerns (check one): Original grant X
Class II change _____

Equipment type: **DSS Spread Spectrum**

Deferred grant requested per 47 CFR 0.457(d)(1)(ii)? yes _____ No X

If yes, defer until: _____
date

N.A. agrees to notify the Commission by N.A.
date

of the intended date of announcement of the product so that the grant can be issued on that date.

Report prepared by:

SECTION 1

GENERAL INFORMATION

GENERAL INFORMATION

1.1 Product Description

The Equipment Under Test (EUT) is a Signal Golf International Pte. Ltd., Model Smartpin. The Smartpin is the flag pole portion of an advanced yardage measurement system for use on golf courses. The EUT is a DSS spread spectrum device designed to operate from 2421.6 MHz – 2461.6 MHz. The EUT is designed to transmit only in response to a request from a hand held unit used by golfers.

The other portion of this system is the Yard Dog, which is a hand held transceiver. The system is designed to determine the distance between the hand held unit (used by a golfer) to the flag pole on the green.

1.2 Related Submittal(s)/Grant(s)

The EUT will be used with part of a system to send/receive data. The transceiver presented in this report will be used with another transceiver which has been submitted under FCC ID: P2T010407-0D.

The EUT is subject to the following authorizations:

- a) Certification as a transceiver
- b) Verification as a digital device

The information contained in this report is presented for the certification & verification authorization(s) for the EUT.

SECTION 2

TESTS AND MEASUREMENTS

TEST AND MEASUREMENTS

2.1 Configuration of Tested System

The sample was tested per ANSI C63.4, Methods of Measurement from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz (1992). Conducted and radiated emissions data were taken with the test receiver or spectrum analyzer's resolution bandwidth adjusted to 9 kHz and 120 kHz, respectively. All measurements are peak unless stated otherwise. The video filter associated with the spectrum analyzer was off throughout the evaluation process. Interconnecting cables were manipulated as necessary to maximize emissions. Interconnecting cables were manipulated as necessary to maximize emissions. A block diagram of the tested system is shown in Figure 1. Test configuration photographs for spurious and fundamental emissions are shown in Figure 2.

Since the EUT is normally used while on a flag pole, the EUT was positioned upright for all tests.

2.2 Test Facility

Testing was performed at US Tech's measurement facility at 3505 Francis Circle, Alpharetta, GA. This site has been fully described and submitted to the FCC, and accepted in their letter marked 31040/SIT. Additionally this site has also been fully described and submitted to Industry Canada (IC), and has been approved under file number IC2982.

2.3 Test Equipment

Table 2 describes test equipment used to evaluate this product.

2.4 Modifications

No modifications were made by US Tech, to bring the EUT into compliance with FCC Part 15 limits for the transmitter portion of the EUT or the Class B Digital Device Requirements.

2.6 Antenna Description (Paragraph 15.203)

An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this section.

The Model Signal Golf International Pte. Ltd. Smartpin incorporates an integrated antenna only. The antenna is a PIN antenna with a gain of 2.3 dBi. The antenna is a 0.566 wavelength antenna.

2.7 Peak Power Within the Band 2.4 – 2.4835 GHz per FCC Section 15.247(b)

Peak power within the band 2.4 – 2.4835 GHz has been measured with a spectrum analyzer by connecting the spectrum analyzer directly via a short cable to the antenna output terminals or across the antenna leads on the PCB as specified by the manufacturer. The spectrum analyzer did not have a RBW greater than the 6 B bandwidth for the largest fundamental bandwidth, therefore this data was taken using the channel power function of the spectrum analyzer. The results of the measurements are given in Table 3 and Figure 3a through Figure 3c.

The EUT did not incorporate any antennas of directional gain greater than 6 dBi, therefore the output power has not been reduced as required by 15.247(b)(3).

2.8 Antenna Conducted Spurious Emission in the Frequency Range 30 - 25000 MHz (FCC Section 15.247(c))

Antenna Conducted spurious emissions in the frequency range 30 - 25000 MHz have been measured with a spectrum analyzer by connecting the spectrum analyzer directly via a short cable to the antenna output terminals or across the antenna leads on the PCB as specified by the manufacturer. The spectrum analyzer was set for a 50 Ω impedance with the RBW = 100 kHz & VBW > RBW. All spurious emissions were measured to be greater than 20 dB down from the fundamental. The results of conducted spurious emissions are given in Figure 4a through Figure 4l.

2.9 Peak Radiated Spurious Emission in the Frequency Range 30 -25000 MHz (FCC Section 15.247(c))

A preliminary scan was performed on the EUT to determine frequencies that were caused by the transmitter portion of the product. Significant emissions that fell within restricted bands were then measured on an OAT's site. Radiated measurements below 1 GHz were tested with a RBW = 120 kHz. Radiated measurements above 1 GHz were measured using a RBW = VBW = 1 MHz. The results of peak radiated spurious emissions falling within restricted bands are given in Table 4a (low), Table 4b, (mid), Table 4c (high) and Figure 5a-5b (low), Figure 5c-5d (mid) and Figure 5e-5f (high).
