Federal Communications Commission,
Authorization & Evaluation Division,
7435 Oakland Mills Road
Columbia, MD. 21046

Attention: Equipment Authorization Branch

We hereby certify that the transceiver FCC ID: P4JDTE-3 complies with ANSI/IEEE C95.1-1992 Standard for Safety Levels with Respect to Human Exposure to Radio Frequency Electromagnetic Fields, 3 kHz to 300 GHz.

Compliance was determined by testing appropriate parameters according to standard.

SAR Compliance Test Report

Test report no.:	Not numbered	Date of report:	2002-12-17
Number of pages:	92	Contact person:	Pentti Pärnänen
		Responsible test engineer:	Pertti Mäkikyrö

Testing laboratory:	Nokia Corporation Elektroniikkatie 10 P.O. Box 50 FIN-90571 OULU Finland Tel. +358-7180-08000 Fax. +358-7180-47222	Client:	Nokia Corporation Yrttipellontie 10 P.O. Box 300 FIN-90230 OULU Finland Tel.+358-7180-08000 Fax. +358-7180-58300

Tested devices:	P4JDTE-3
Supplement reports:	-
Testing has been carried out in accordance with:	47CFR §2.1093 Radiofrequency Radiation Exposure Evaluation: Portable Devices IEEE P1528-200X Draft 6.4 Recommended Practice for Determining the Peak Spatial-Average Specific Absorption Rate (SAR) in the Human Body Due to Wireless Communications Devices: Experimental Techniques FCC OET Bulletin 65 (Edition 97-01), Supplement C (Edition 01-01) Evaluating Compliance with FCC Guidelines for Human Exposure to Radiofrequency Electromagnetic Fields
Documentation:	The documentation of the testing performed on the tested devices is archived for 15 years at TCC Oulu
Test results:	**The tested device complies with the requirements in respect of all parameters subject to the test.** The test results and statements relate only to the items tested. The test report shall not be reproduced except in full, without written approval of the laboratory.

Date and signatures: 2002-12-17

Measurement performed by	Anne Kiviniemi

1.1 Maximum Results Found during SAR Evaluation

The equipment is deemed to fulfil the requirements if the measured values are less than or equal to the limit. Maximum found results are reported per operating band.

1.1.1 Body Worn Configuration

Mode	Ch / *f* (MHz)	Power	Separation Distance	Limit	Measured	Result
GPRS 850	128/824.20	29.2 dBm	18.9 mm	1.6 mW/g	0.59 mW/g	PASSED
GPRS 1900	512/1850.20	29.9 dBm	18.9 mm	1.6 mW/g	0.90 mW/g	PASSED
WLAN	6/2437	17.1 dBm	18.8 mm	1.6 mW/g	0.15 mW/g	PASSED

1.1.2 Measurement Uncertainty

Combined Standard Uncertainty	± 13.6%
Expanded Standard Uncertainty (k=2)	± 27.1%

2. DESCRIPTION OF TESTED DEVICE

Device category	Portable device		
Exposure environment	Uncontrolled exposure		
Unit type	Prototype unit		
Modes of Operation	GSM	GPRS	WLAN
Modulation Mode	Gaussian Minimum Shift Keying	Gaussian Minimum Shift Keying	Differential Quadrature Phase Shift Keying
Duty Cycle	1/8	2/8	4/5
Transmitter Frequency Range (MHz)	824.2 – 848.8 1850.2 -1909.8	824.2 - 848.8 1850.2 -1909.8	2412-2462

2.1 Picture of Tested Device

2.2 Description of the Antenna

Type	Internal integrated antenna
Location	Tip of the device

2.3 Snap-on spacer

Snap-on spacer was attached to P4JDTE-3 during body worn measurements.

3. TEST CONDITIONS

3.1 Ambient Conditions

Ambient temperature (°C)	22±2
Tissue simulating liquid temperature (°C)	22±2
Humidity	42

3.2 RF characteristics of the test site

Tests were performed in a enclosed RF shielded environment.

3.3 Test Signal, Frequencies, and Output Power

The device was controlled by using a test mode software and by using a radio tester. GSM mode was not tested since P4JDTE-3 is able to use two time slots for transmitting data in GPRS mode whereas GSM mode uses only one time slot.

P4JDTE-3 is capable of operating in several host products. Typical laptops IBM ThinkPad T23, IBM ThinkPad 560x, IBM ThinkPad 600x and pocket PCs: Casio Cassiopeia, Compaq iPAQ and Hewlett Packard Jornada were chosen for testing.

In 850 and 1900 MHz operating bands the measurements were performed on lowest, middle and highest channels and in 2450 MHz band measurements were performed at the middle channel only, because each test configuration in that channel was more than 3.0dB lower than the SAR limit. Maximum power level was used during the all tests.

DASY3 system measures power drift during SAR testing by comparing e-field in the same location at the beginning and at the end of measurement. These records were used to monitor stability of power output.

4. DESCRIPTION OF THE TEST EQUIPMENT

The measurements were performed with an automated near-field scanning system, DASY3, manufactured by Schmid & Partner Engineering AG (SPEAG) in Switzerland.

Test Equipment	Serial Number	Due Date
DASY3 DAE V1	405	02/03
E-field Probe ET3DV6	1379	02/03
Dipole Validation Kit, D835V2	448	11/03
Dipole Validation Kit, D1900V2	511	02/03

E-field probe calibration records are presented in Appendix C.

Additional equipment needed in validation

Test Equipment	Model	Serial Number	Due Date
Signal Generator	Agilent E4433B	GB40050947	09/04
Amplifier	Amplifier Research 5S1G4	27573	-
Power Meter	R&S NRT	835065/049	04/03
Power Sensor	R&S NRT-Z44	835374/021	04/03
Thermometer	DO9416	1505985462	-
Vector Network Analyzer	Hewlett Packard 8753E	US38432701	05/03
Dielectric Probe Kit	Agilent 85070C	-	-

4.1 System Accuracy Verification

The probes are calibrated annually by the manufacturer. Dielectric parameters of the simulating liquids are measured by using a dielectric probe kit and a vector network analyzer.

The SAR measurement of the DUT were done within 24 hours of system accuracy verification, which was done using the dipole validation kit.

The dipole antenna, which is manufactured by Schmid & Partner Engineering AG, is matched to be used near flat phantom filled with tissue simulating solution. Length of 835 MHz dipole is 161mm with overall height of 330mm. Dipole length for 1900 MHz is 68 mm with overall height of 300mm. A specific distance holder is used in the positioning of both antennas to ensure correct spacing between the phantom and the dipole. Manufacturer's reference dipole data is presented in Appendix C.

Due to lack of dipole and verification data for 2450 MHz, system verification for WLAN measurements were done with dipole for 1900MHz .

Power level of 250 mW was supplied to a dipole antenna placed under the flat section of SAM phantom. The validation results are in the table below and printout of the validation test is presented in Appendix A. All the measured parameters were within the specification.

Tissue	*f* (MHz)	Description	SAR (W/kg), 1g	Dielectric Parameters		Temp (°C)
				ε_r	σ (S/m)	
Muscle	835	Measured 11/15/2002	2.75	57.9	0.95	22

4.2 Tissue Simulants

All dielectric parameters of tissue simulants were measured within 24 hours of SAR measurements. The depth of the tissue simulant in the ear reference point of the phantom was 15cm ± 5mm during all the tests. Volume for each tissue simulant was 26 liters.

4.2.1 Muscle Tissue Simulant

The composition of the muscle tissue simulating liquid for 835MHz is

55.97% De-Ionized Water
41.76% Sugar
1.21% HEC
0.79% Salt
0.27% Preservative

and for 1900MHz

69.02% De-Ionized Water
30.76% Diethylene Glycol Monobutyl Ether
0.22% Salt

and for 2450 MHz

70.0% De-Ionized Water
30.0% Diethylene Glycol Monobutyl Ether

f (MHz)	Description	Dielectric Parameters		Temp (°C)
		ε_r	σ (S/m)	
835	Measured 11/15/2002	57.9	0.95	22
	Recommended Values	55.2	0.97	20-26
835	Measured 11/17/2002	56.8	0.95	22
	Recommended Values	55.2	0.97	20-26

	Recommended Values	53.3	1.52	20-26
1880	Measured 11/24/2002	51.2	1.47	22
	Recommended Values	53.3	1.52	20-26
2450	Measured 11/29/2002	53.7	2.05	22
	Recommended Values	52.7	1.95	20-26

Recommended values are adopted from OET Bulletin 65 (97-01) Supplement C (01-01).

4.3 Phantoms

“SAM v4.0” phantom", manufactured by SPEAG, was used during the measurement. It has fiberglass shell integrated in a wooden table. The shape of the shell corresponds to the phantom defined by SCC34-SC2. It enables the dosimetric evaluation of left and right hand phone usage as well as body mounted usage at the flat phantom region. Reference markings on the phantom allow the complete setup of all predefined phantom positions and measurement grids by manually teaching three points in the robot.

The thickness of phantom shell is 2 mm except for the ear, where an integrated ear spacer provides a 6 mm spacing from the tissue boundary. Manufacturer reports tolerance in shell thickness to be ±0.1mm.

4.4 Isotropic E-Field Probe ET3DV6

Construction	Symmetrical design with triangular core Built-in optical fiber for surface detection system Built-in shielding against static charges PEEK enclosure material (resistant to organic solvents, e.g., glycolether)
Calibration	Calibration ceritifcate in Appendix C
Frequency	10 MHz to 3 GHz (dosimetry); Linearity: ± 0.2 dB (30 MHz to 3 GHz)
Optical Surface Detection	± 0.2 mm repeatability in air and clear liquids over diffuse reflecting surfaces
Directivity	± 0.2 dB in HSL (rotation around probe axis) ± 0.4 dB in HSL (rotation normal to probe axis)
Dynamic Range	5 µW/g to > 100 mW/g; Linearity: ± 0.2 dB
Dimensions	Overall length: 330 mm Tip length: 16 mm Body diameter: 12 mm Tip diameter: 6.8 mm Distance from probe tip to dipole centers: 2.7 mm
Application	General dosimetry up to 3 GHz Compliance tests of mobile phones Fast automatic scanning in arbitrary phantoms

5. DESCRIPTION OF THE TEST PROCEDURE

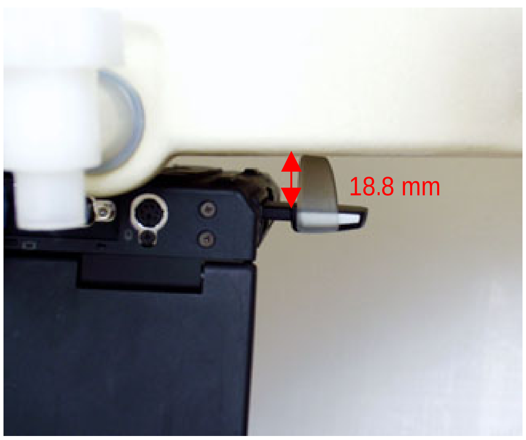
5.1 Test Positions

P4JDTE-3 with Snap-On spacer attached was placed into laptops and pocket PCs and then below the flat section of the phantom using a device holder and expanded polystyrene (EPS).

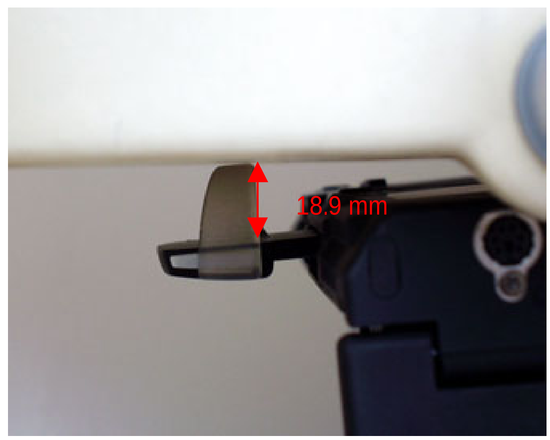
Two positions were used to test compliance. These positions correspond to applicaple operating configurations.

5.1.1 Position for testing the lower part area of P4JDTE-3

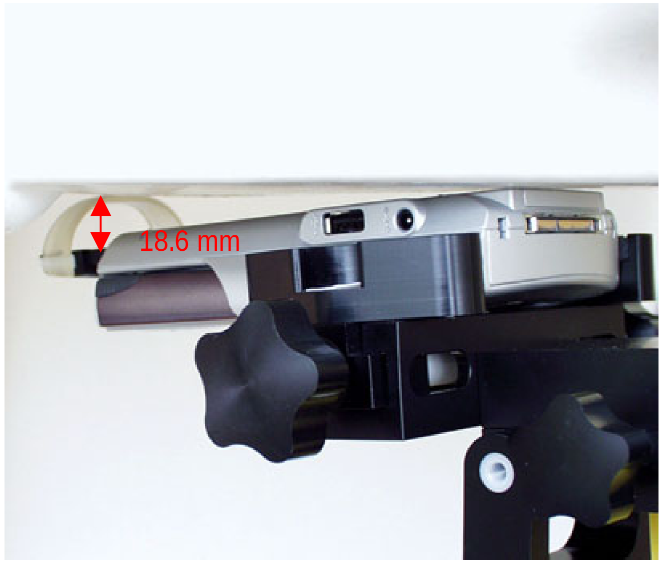
Laptop IBM 560x, all the laptops were positioned similary for testing underneath P4JDTE-3



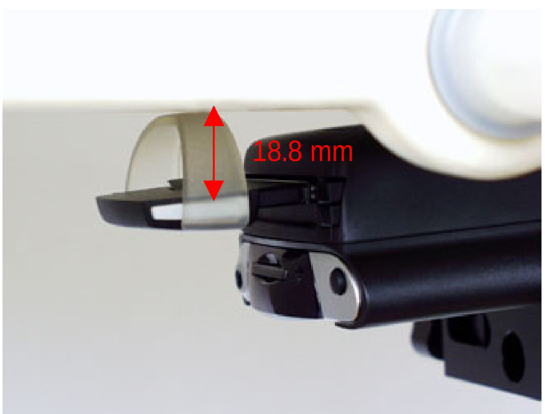
Laptop IBM 600x



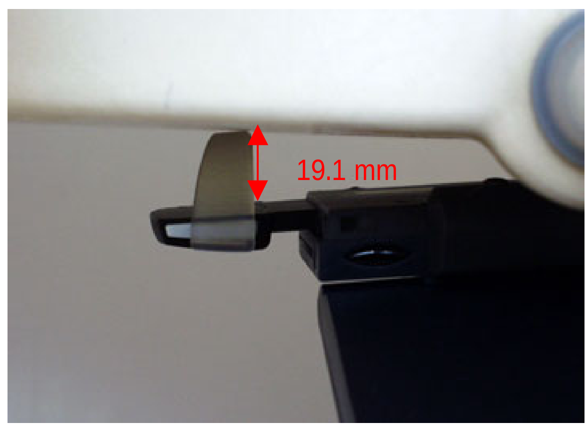
Laptop IBM t23



Pocket PC Casio Cassiopeia, all the pocket PCs were positioned similary for testing underneath P4JDTE-3

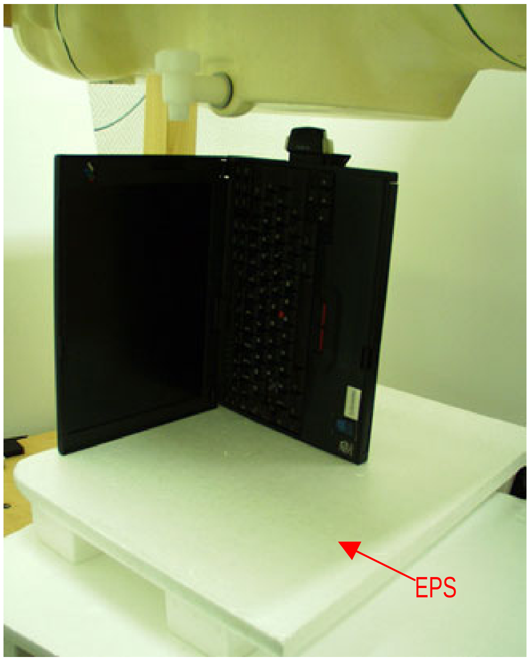


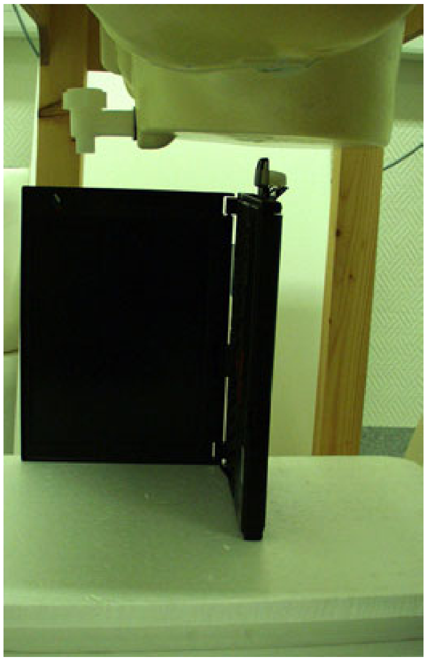
Pocket PC Compaq iPAQ



Handheld PC Hewlett Packard Jornada

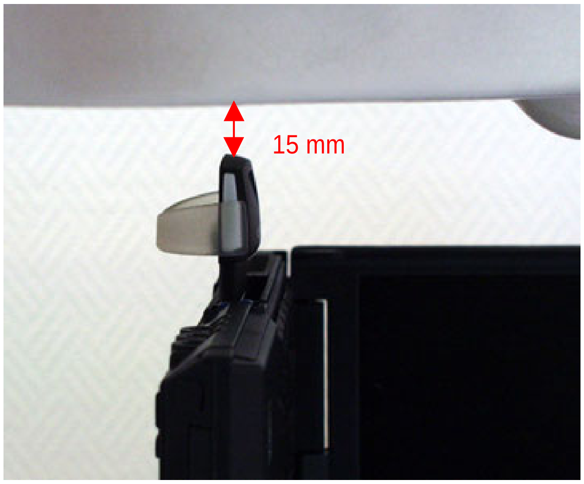
5.1.2 Position for testing the tip area of P4JDTE-3





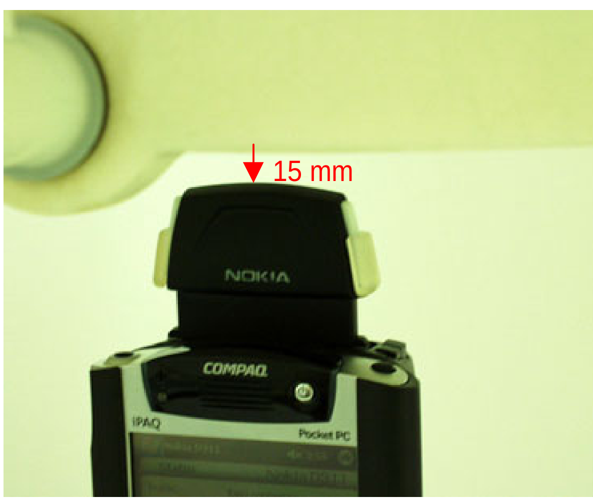
Laptop IBM 560x, all the laptops were positioned similary for testing the tip of P4JDTE-3 with separation distance 15mm.

Laptop IBM 600x



Laptop IBM T23

Pocket PC Casio Cassiopeia, all the pocket PCs were positioned similary for testing the tip of P4JDTE-3 with separation distance 15mm.



Pocket PC Compaq iPAQ

Handheld PC Hewlett Packard Jornada

5.2 Scan Procedures

First coarse scans are used for quick determination of the field distribution. Next a cube scan, 5x5x7 points; spacing between each point 8x8x5 mm, is performed around the highest E-field value to determine the averaged SAR-distribution over 1g.

5.3 SAR Averaging Methods

The maximum SAR value is averaged over its volume using interpolation and extrapolation.

The interpolation of the points is done with a 3d-Spline. The 3d-Spline is composed of three one-dimensional splines with the "Not a knot" -condition [W. Gander, Computermathematik, p. 141-150] (x, y and z -directions) [Numerical Recipes in C, Second Edition, p 123].

The extrapolation is based on least square algorithm [W. Gander, Computermathematik, p.168-180]. Through the points in the first 30 mm in all z-axis, polynomials of order four are calculated. This polynomial is then used to evaluate the points between the surface and the probe tip. The points, calculated from the surface, have a distance of 1mm from one another.

6. MEASUREMENT UNCERTAINTY

6.1 Description of Individual Measurement Uncertainty

6.1.1 Assessment Uncertainty

Uncertainty description	Uncert. value %	Probability distribution	Div.	c_i^1	Stand. uncert (1g) %	v_i^2 or v_{eff}
Measurement System						
Probe calibration	± 4.4	normal	1	1	± 4.4	∞

Expanded Standard Uncertainty (k=2)					± 27.1	

7. RESULTS

Corresponding SAR distribution printouts of maximum results in every operating mode and position are shown in Appendix B. It also includes Z-plots of maximum measurement results in body worn configurations. The SAR distributions are substantially similar or equivalent to the plots submitted regardless of used channel in each mode and position. As all WLAN SAR results with the laptop PCs were below 0.16 W/kg, WLAN was not remeasured with the pocket PCs.

Dipole 835 MHz

SAM 3; Flat

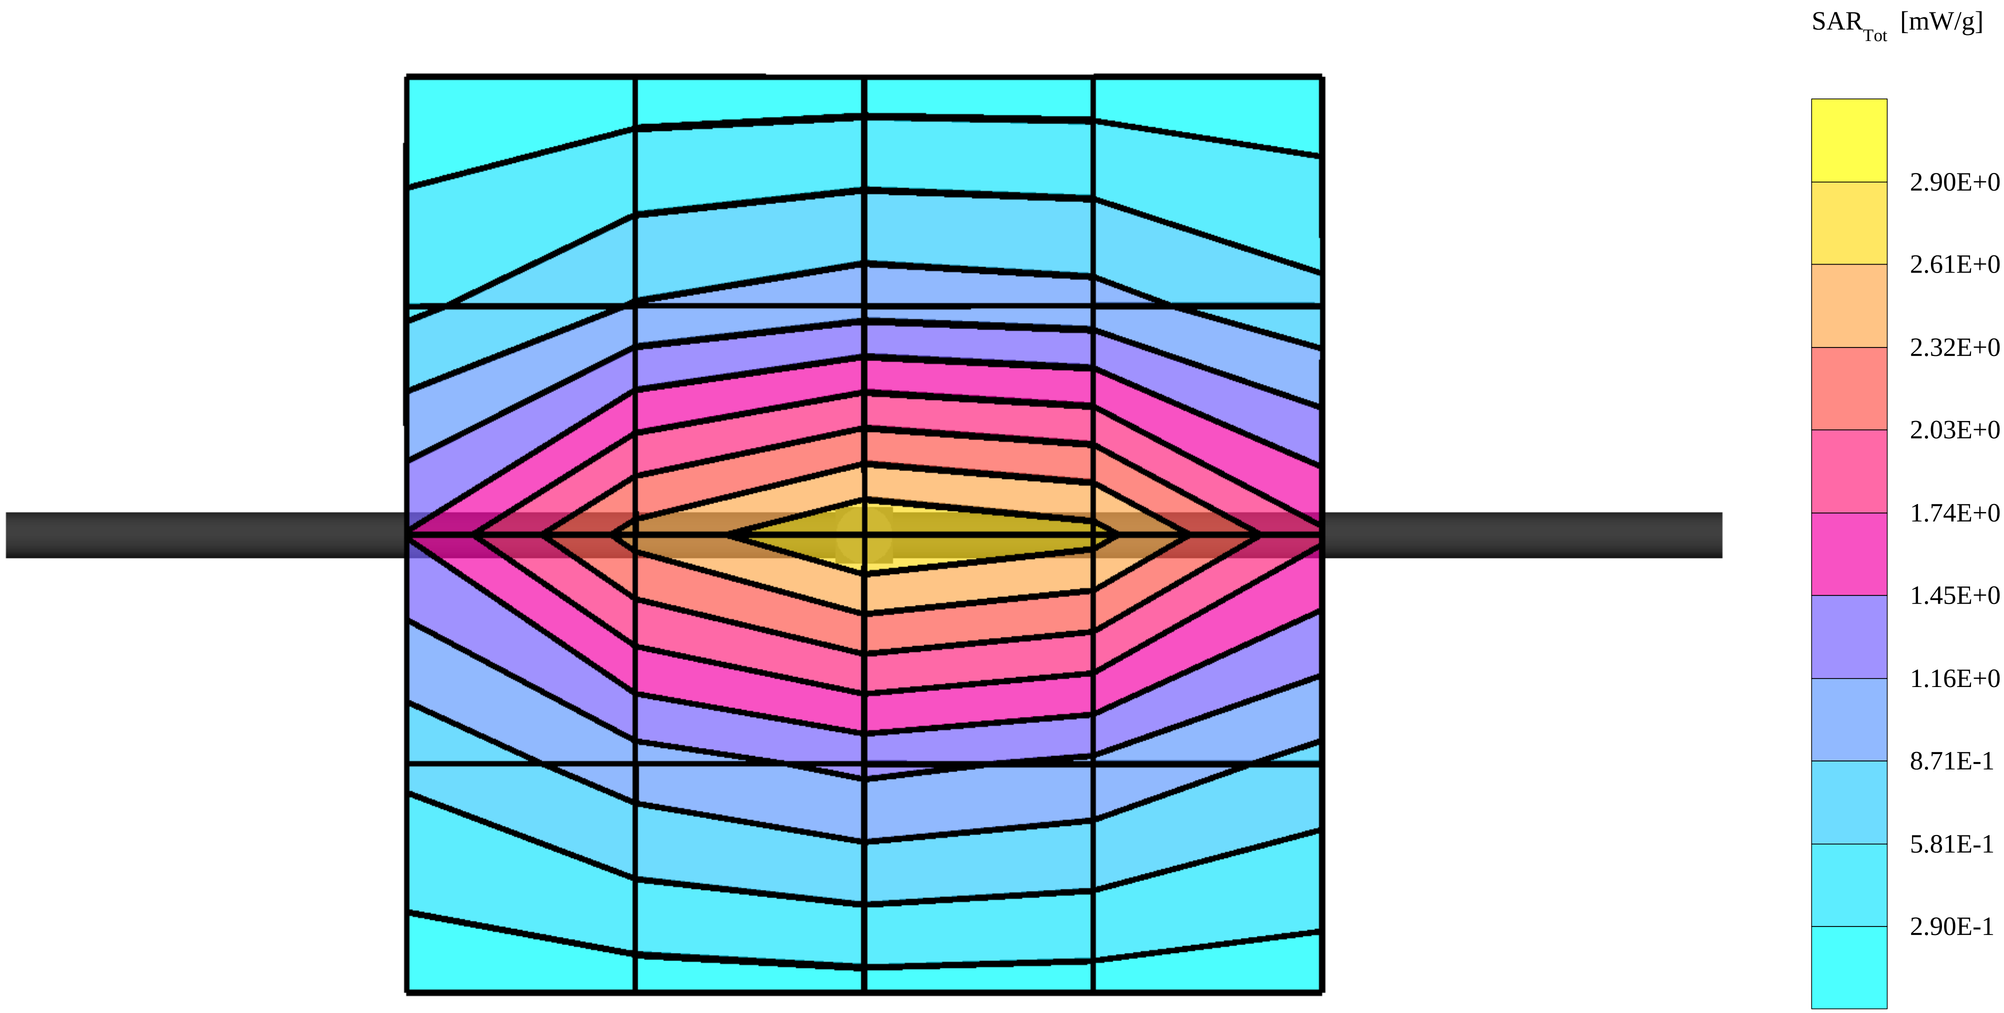
Probe: ET3DV6 - SN1379; ConvF(6.20,6.20,6.20); Crest factor: 1.0; Muscle 836 MHz: $\sigma = 0.96$ mho/m $\varepsilon_r = 56.8$ $\rho = 1.00$ g/cm³; Liquid temperature: 21.9 °C

Cubes (2): Peak: 4.35 mW/g ± 0.06 dB, SAR (1g): 2.73 mW/g ± 0.01 dB, SAR (10g): 1.76 mW/g ± 0.06 dB

Penetration depth: 12.7 (11.2, 14.8) [mm]

Powerdrift: -0.03 dB



11/13/02

Dipole 1900 MHz

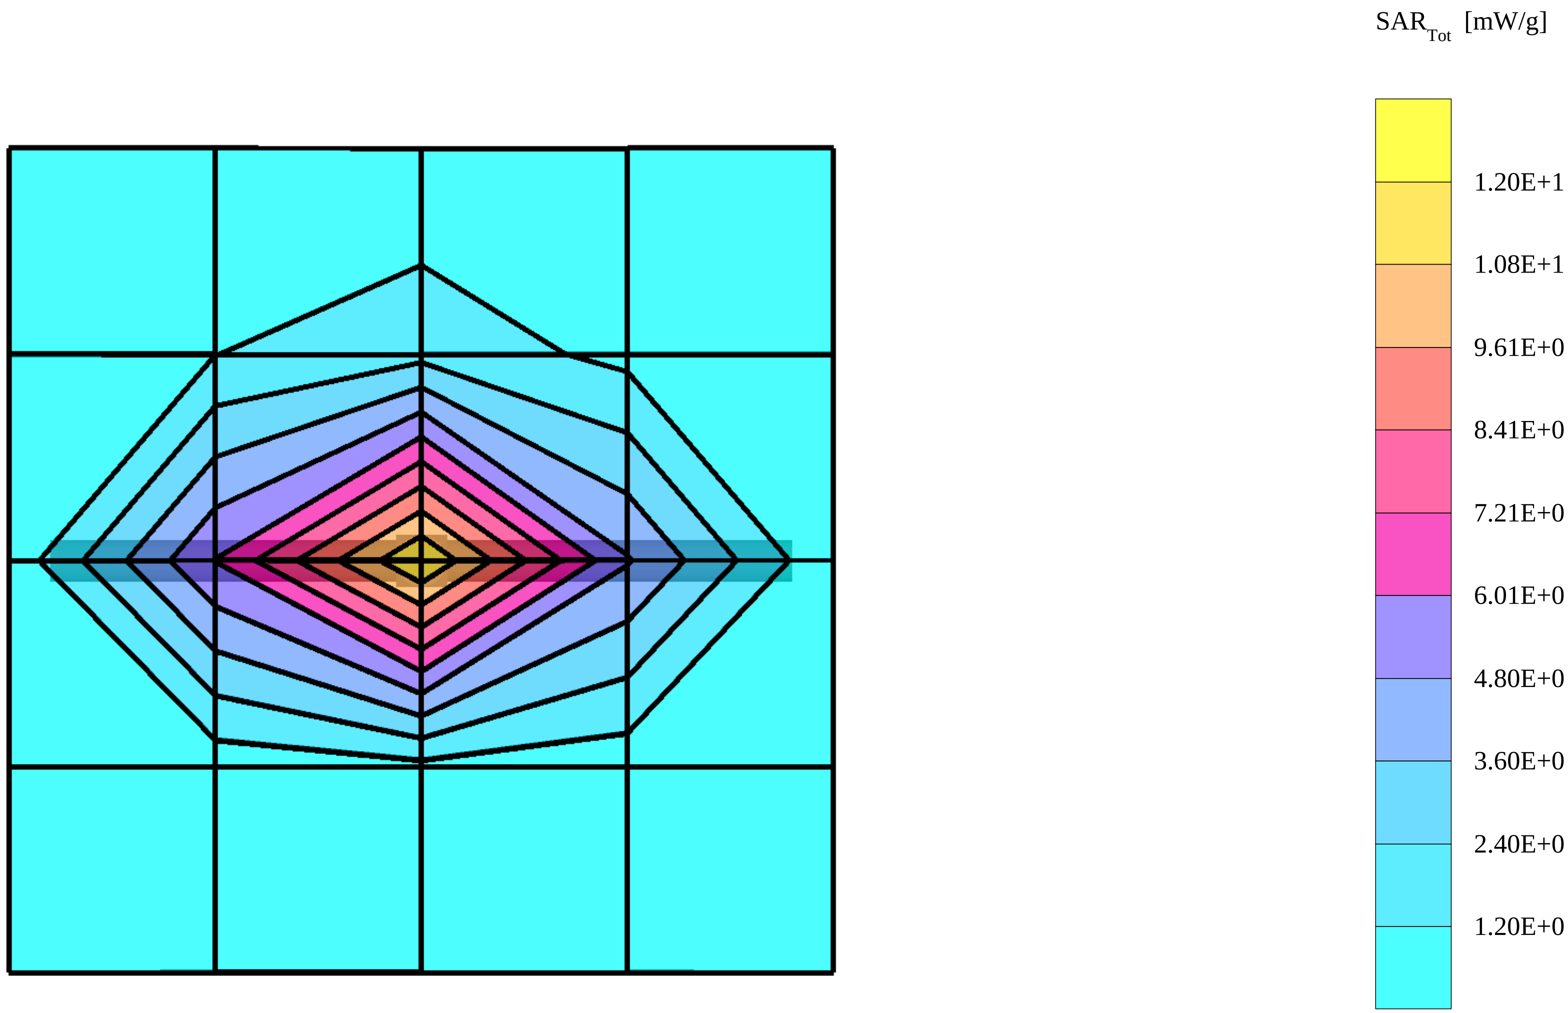
SAM 1; Flat

Probe: ET3DV6 - SN1379; ConvF(4.80,4.80,4.80); Crest factor: 1.0; Muscle 1900 MHz: σ = 1.50 mho/m ε_r = 50.8 ρ = 1.00 g/cm^3, liquid temperature:21.6 C

Cubes (2): Peak: 20.5 mW/g ± 0.09 dB, SAR (1g): 10.9 mW/g ± 0.08 dB, SAR (10g): 5.53 mW/g ± 0.07 dB

Penetration depth: 8.6 (7.8, 9.9) [mm]

Powerdrift: 0.03 dB



Dipole 1900 MHz

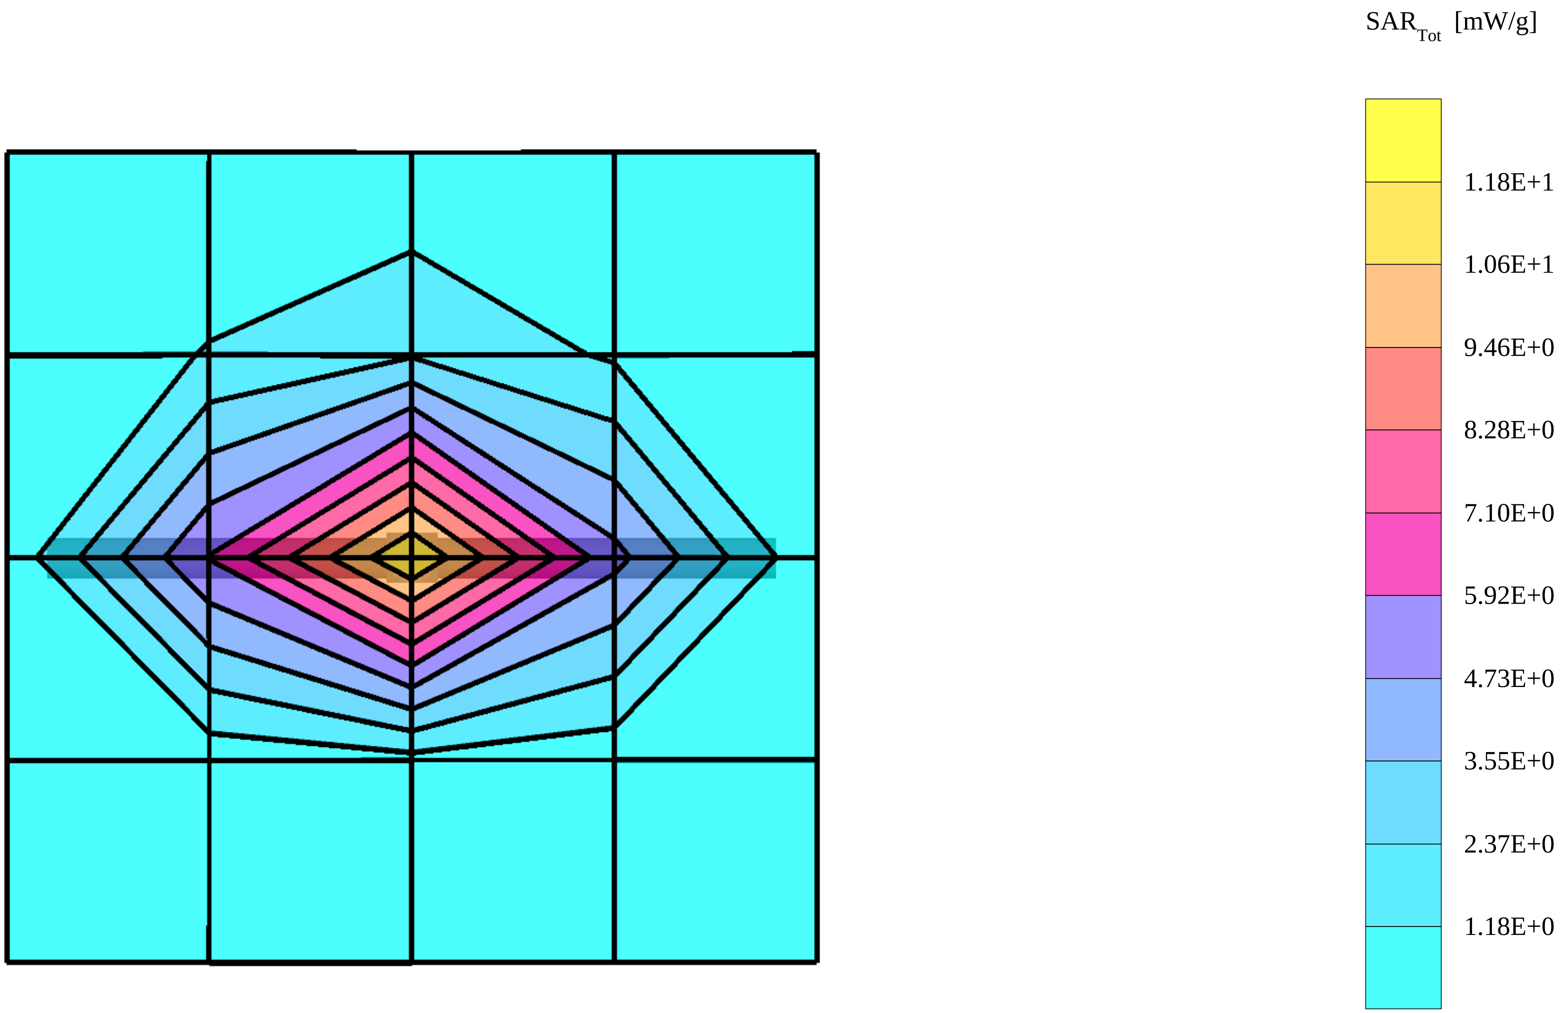
SAM 1; Flat

Probe: ET3DV6 - SN1379; ConvF(4.80,4.80,4.80); Crest factor: 1.0; Muscle 1900 MHz: σ = 1.52 mho/m ϵ_r = 51.0 ρ = 1.00 g/cm^3, liquid temperature: 21.0 C

Cubes (2): Peak: 20.6 mW/g ± 0.08 dB, SAR (1g): 11.0 mW/g ± 0.08 dB, SAR (10g): 5.62 mW/g ± 0.07 dB

Penetration depth: 8.6 (7.9, 9.9) [mm]

Powerdrift: 0.03 dB



Dipole 1900 MHz

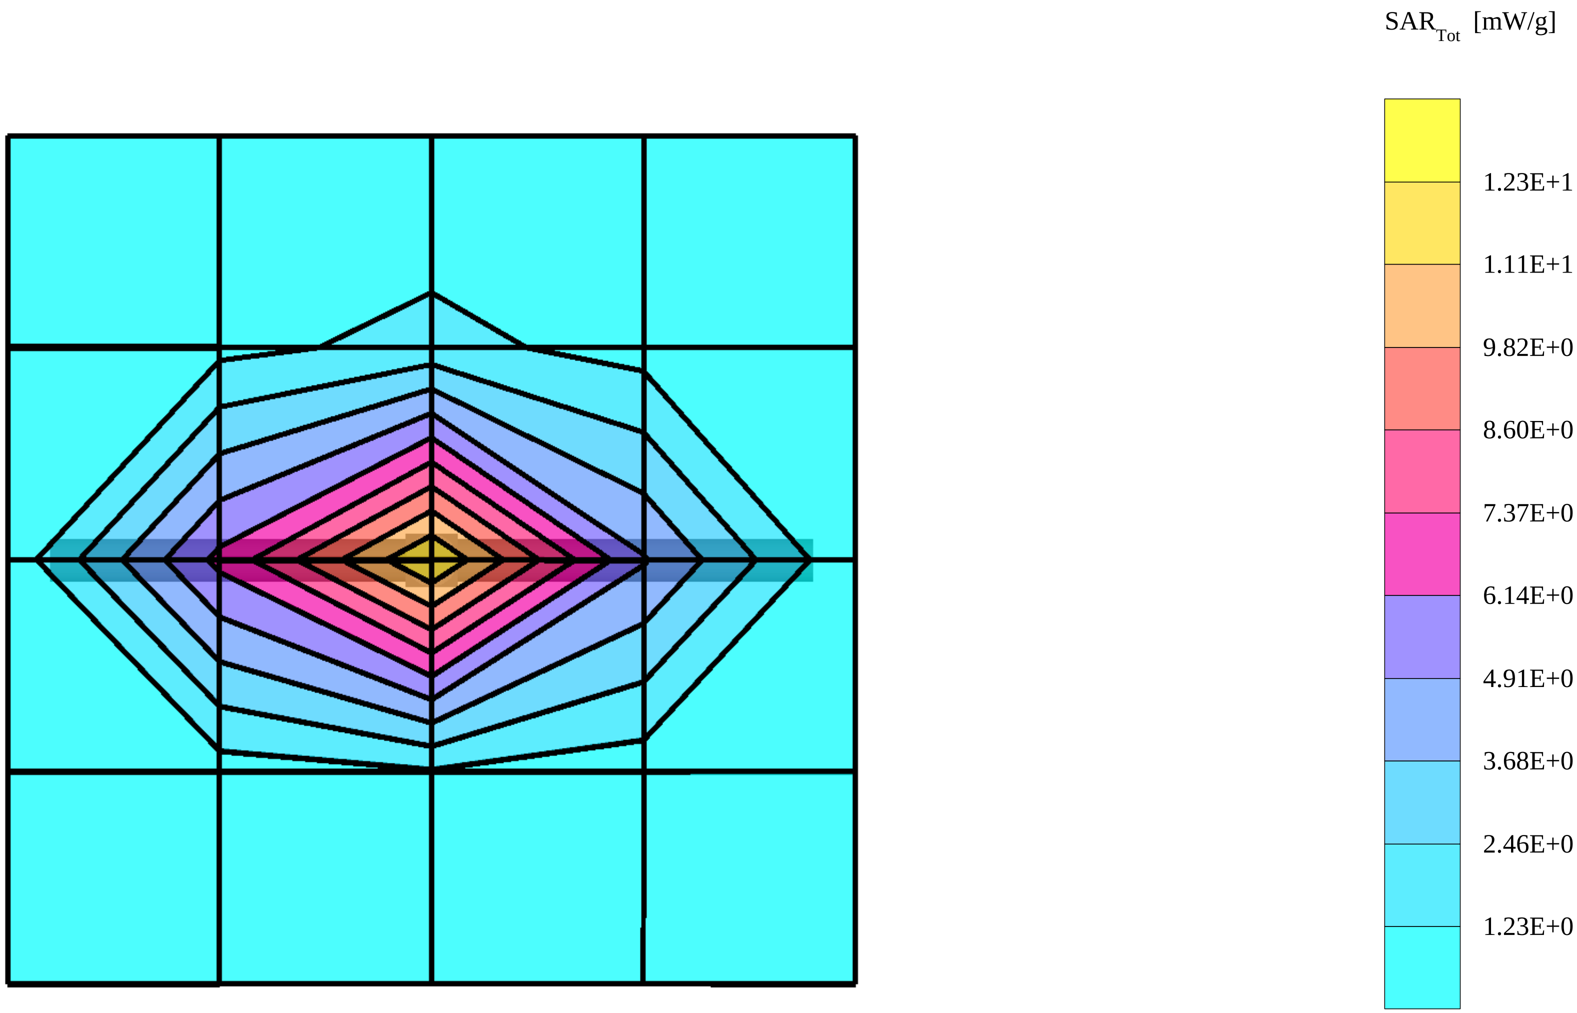
SAM 1; Flat

Probe: ET3DV6 - SN1379; ConvF(4.80,4.80,4.80); Crest factor: 1.0; Muscle 1900 MHz: σ = 1.52 mho/m ε_r = 51.1 ρ = 1.00 g/cm³, liquid temperature: 21.2 C

Cubes (2): Peak: 20.8 mW/g ± 0.10 dB, SAR (1g): 11.0 mW/g ± 0.07 dB, SAR (10g): 5.58 mW/g ± 0.05 dB

Penetration depth: 8.4 (7.7, 9.7) [mm]

Powerdrift: 0.04 dB



Dipole 1900 MHz

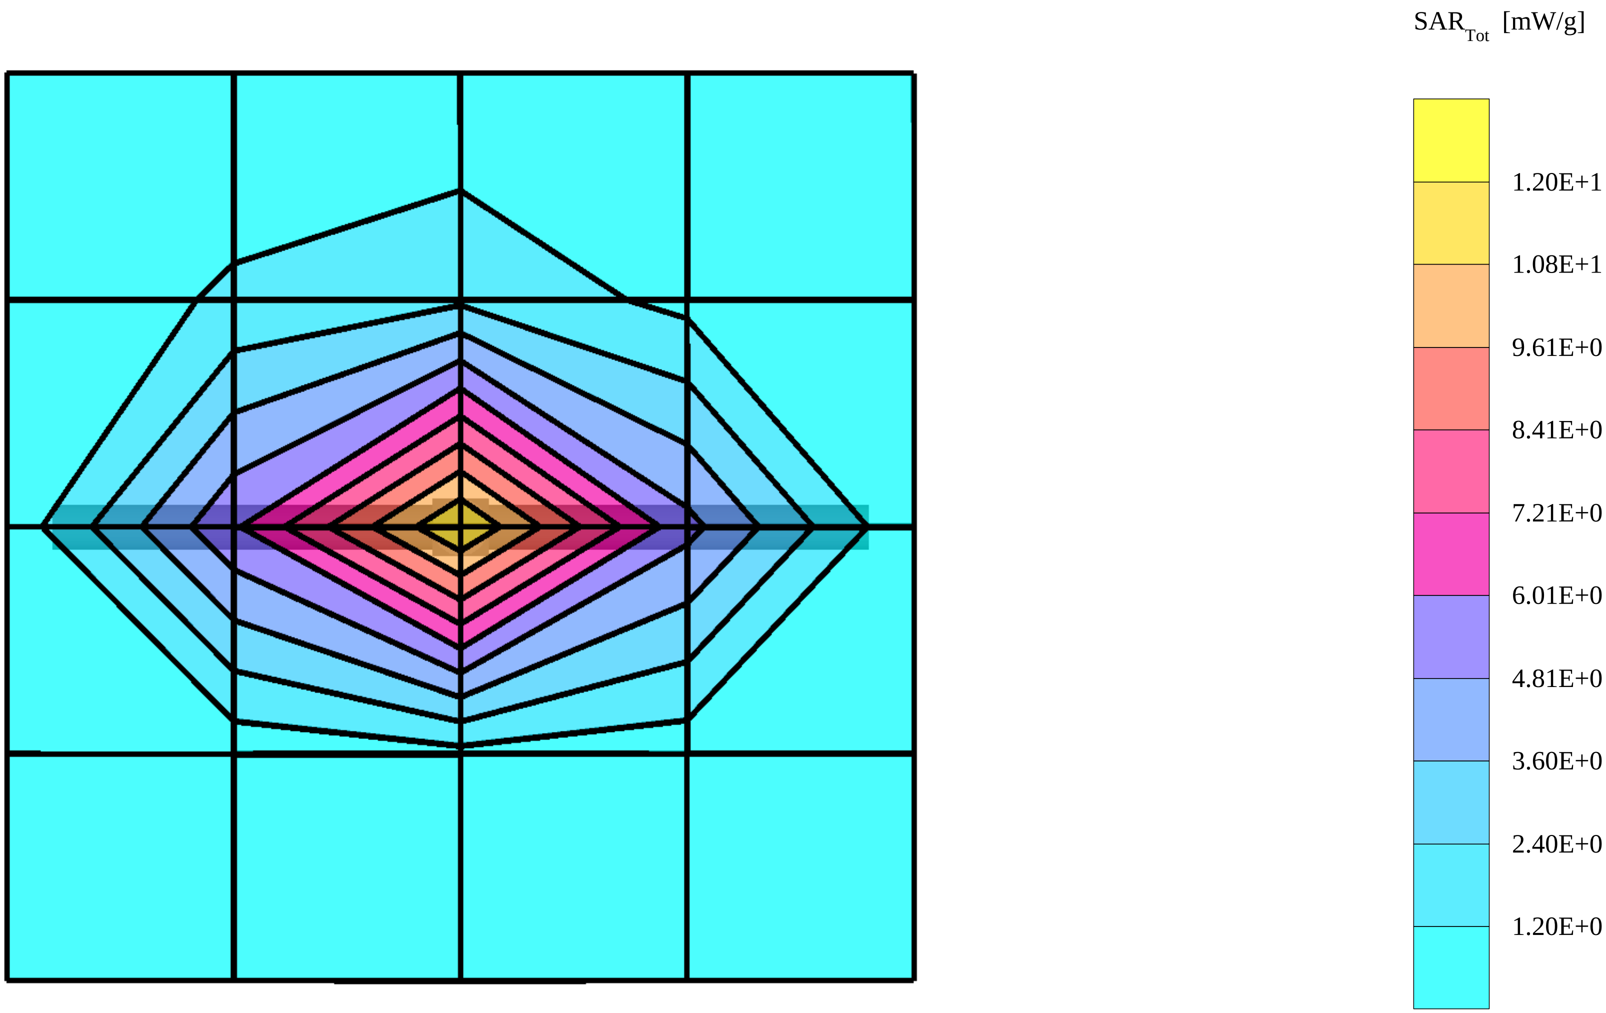
SAM 1; Flat

Probe: ET3DV6 - SN1379; ConvF(4.80,4.80,4.80); Crest factor: 1.0; Muscle 1900 MHz: σ = 1.49 mho/m ε_r = 51.0 ρ = 1.00 g/cm³; Liquid temperature: 21.8 °C

Cubes (2): Peak: 20.8 mW/g ± 0.05 dB, SAR (1g): 11.1 mW/g ± 0.08 dB, SAR (10g): 5.64 mW/g ± 0.09 dB

Penetration depth: 8.6 (7.9, 9.9) [mm]

Powerdrift: -0.01 dB



Dipole 1900 MHz

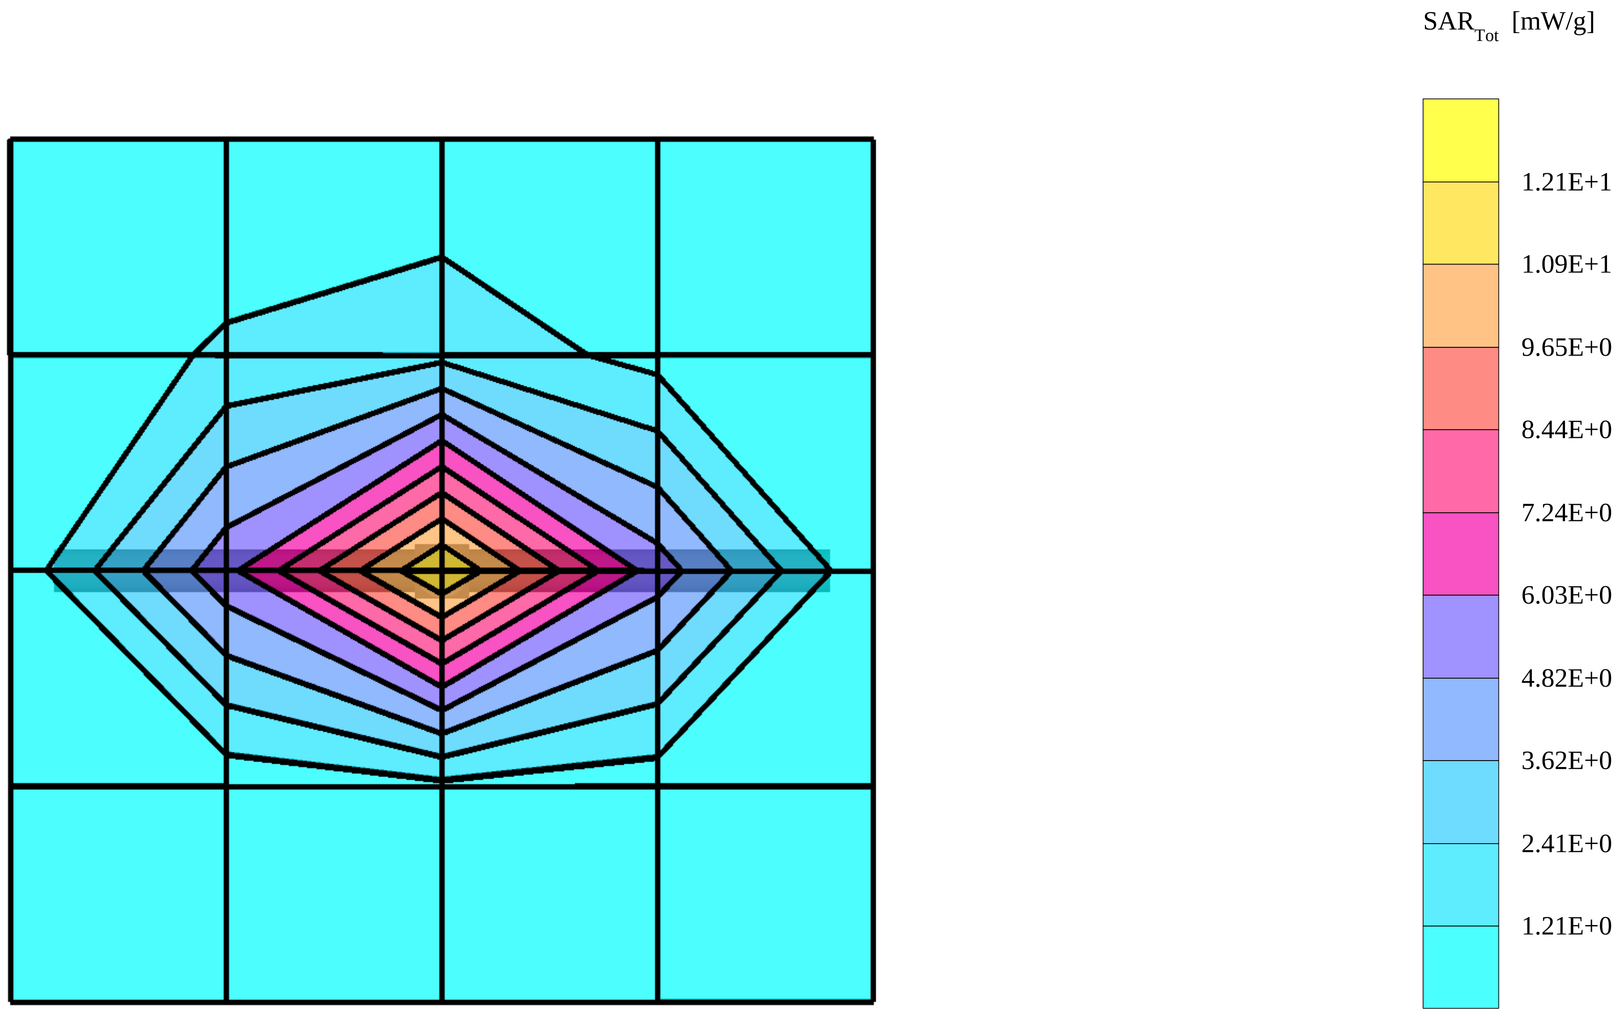
SAM 1; Flat

Probe: ET3DV6 - SN1379; ConvF(4.80,4.80,4.80); Crest factor: 1.0; Muscle 1900 MHz: σ = 1.50 mho/m ϵ_r = 51.0 ρ = 1.00 g/cm^3; Liquid temperature: 21.0 °C

Cubes (2): Peak: 20.5 mW/g ± 0.05 dB, SAR (1g): 10.8 mW/g ± 0.07 dB, SAR (10g): 5.53 mW/g ± 0.08 dB

Penetration depth: 8.5 (7.8, 9.7) [mm]

Powerdrift: 0.03 dB



11/29/02

Dipole 1900 MHz

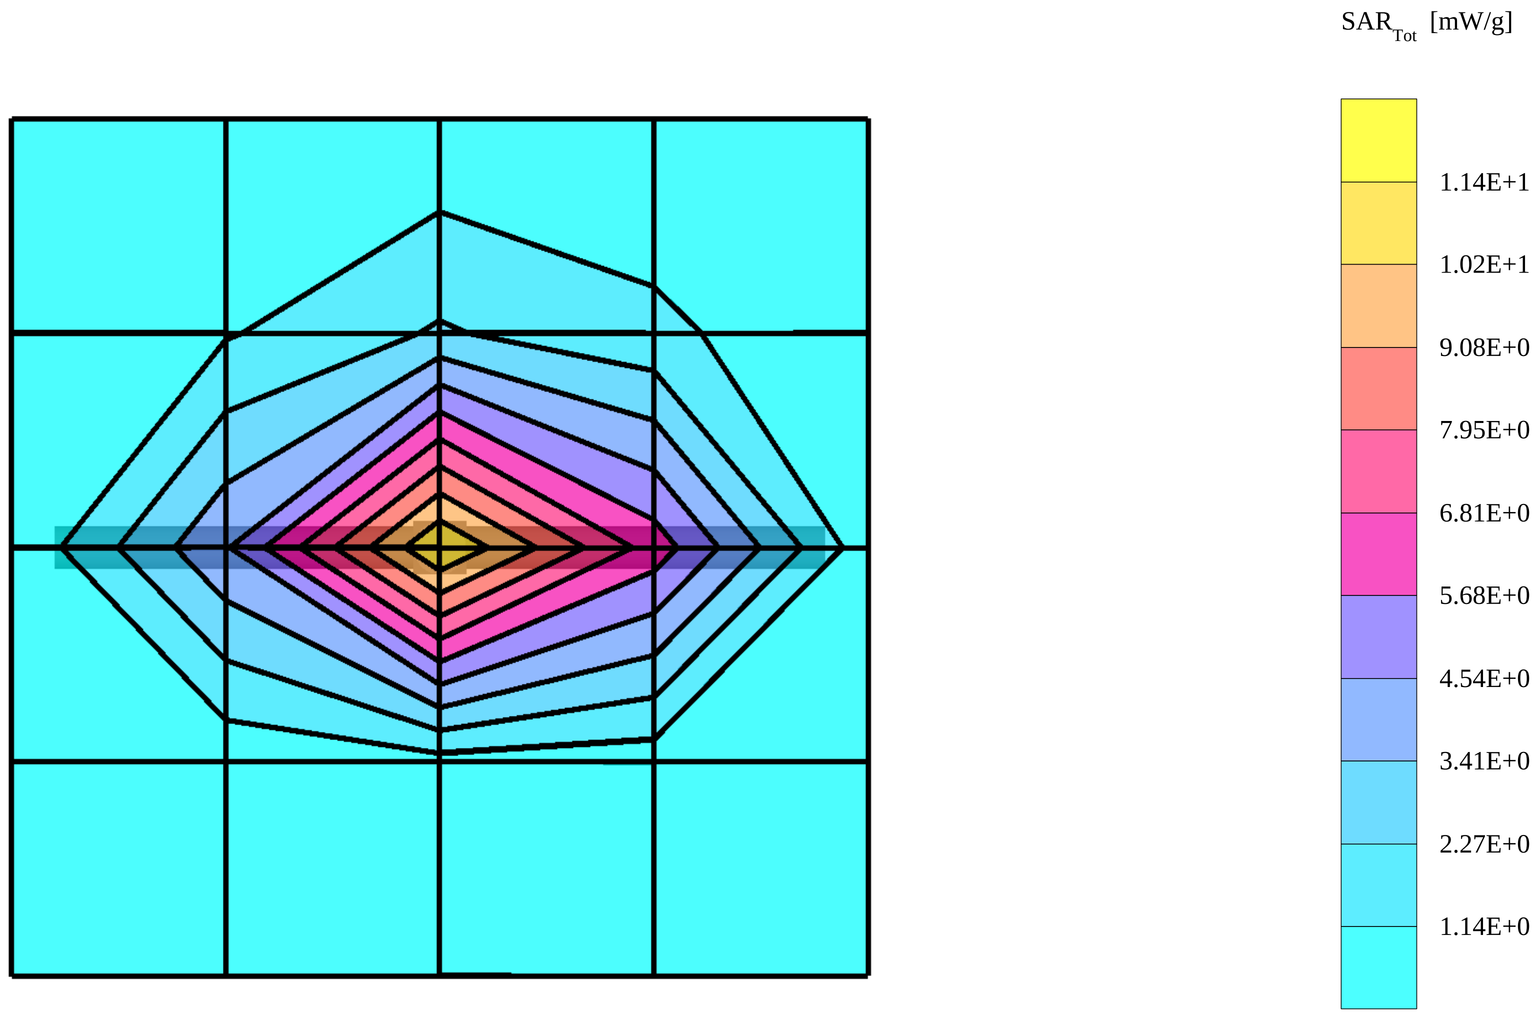
SAM 2; Flat

Probe: ET3DV6 - SN1379; ConvF(4.80,4.80,4.80); Crest factor: 1.0; Muscle 1900 MHz: σ = 1.50 mho/m ε_r = 51.0 ρ = 1.00 g/cm^3; Liquid temperature: 21.9 °C

Cubes (2): Peak: 19.9 mW/g ± 0.01 dB, SAR (1g): 10.6 mW/g ± 0.03 dB, SAR (10g): 5.44 mW/g ± 0.08 dB

Penetration depth: 8.7 (7.9, 10.2) [mm]

Powerdrift: -0.00 dB



APPENDIX B.

SAR Distribution Printouts

Calibration Certificate

Dosimetric E-Field Probe

Type:	**ET3DV6**
Serial Number:	**1379**
Place of Calibration:	**Zurich**
Date of Calibration:	**February 22, 2002**
Calibration Interval:	**12 months**

Schmid & Partner Engineering AG hereby certifies, that this device has been calibrated on the date indicated above. The calibration was performed in accordance with specifications and procedures of Schmid & Partner Engineering AG.

Wherever applicable, the standards used in the calibration process are traceable to international standards. In all other cases the standards of the Laboratory for EMF and Microwave Electronics at the Swiss Federal Institute of Technology (ETH) in Zurich, Switzerland have been applied.

DASY

Dipole Validation Kit

Type: D835V2

Serial: 448

Manufactured: October 24, 2001
Calibrated: November 30, 2001

1. Measurement Conditions

The measurements were performed in the flat section of the new generic twin phantom filled with head simulating solution of the following electrical parameters at 835 MHz:

Relative Dielectricity	**42.3**	± 5%
Conductivity	**0.91 mho/m**	± 5%

The DASY3 System (Software version 3.1c) with a dosimetric E-field probe ET3DV6 (SN:1507, Conversion factor 6.48 at 900 MHz) was used for the measurements.

The dipole was mounted on the small tripod so that the dipole feedpoint was positioned below the center marking of the flat phantom section and the dipole was oriented parallel to the body axis (the long side of the phantom). The standard measuring distance was 15mm from dipole center to the solution surface. The included distance holder was used during measurements for accurate distance positioning.

The coarse grid with a grid spacing of 20mm was aligned with the dipole. The 5x5x7 fine cube was chosen for cube integration. Probe isotropy errors were cancelled by measuring the SAR with normal and 90° turned probe orientations and averaging.
The dipole input power (forward power) was 250mW ± 3 %. The results are normalized to 1W input power.

2. SAR Measurement

Standard SAR-measurements were performed with the phantom according to the measurement conditions described in section 1. The results have been normalized to a dipole input power of 1W (forward power). The resulting averaged SAR-values are:

averaged over 1 cm^3 (1 g) of tissue:	**10.36 mW/g**
averaged over 10 cm^3 (10 g) of tissue:	**6.64 mW/g**

Note: If the liquid parameters for validation are slightly different from the ones used for initial calibration, the SAR-values will be different as well.

3. Dipole Impedance and Return Loss

The impedance was measured at the SMA-connector with a network analyzer and numerically transformed to the dipole feedpoint. The transformation parameters from the SMA-connector to the dipole feedpoint are:

Electrical delay:	**1.404 ns**	(one direction)
Transmission factor:	**0.995**	(voltage transmission, one direction)

The dipole was positioned at the flat phantom sections according to section 1 and the distance holder was in place during impedance measurements.

Feedpoint impedance at 835 MHz:	Re{Z} = **49.1 Ω**
	Im {Z} = **-5.3 Ω**
Return Loss at 835 MHz	**-25.3 dB**

4. Measurement Conditions

The measurements were performed in the flat section of the new generic twin phantom filled with muscle simulating solution of the following electrical parameters at 835 MHz:

Relative Dielectricity	**56.0**	± 5%
Conductivity	**0.98 mho/m**	± 5%

The DASY3 System (Software version 3.1c) with a dosimetric E-field probe ET3DV6 (SN:1507, Conversion factor 6.10 at 900 MHz) was used for the measurements.

The dipole was mounted on the small tripod so that the dipole feedpoint was positioned below the center marking of the flat phantom section and the dipole was oriented parallel to the body axis (the long side of the phantom). The standard measuring distance was 15mm from dipole center to the solution surface. The included distance holder was used during measurements for accurate distance positioning.

The coarse grid with a grid spacing of 20mm was aligned with the dipole. The 5x5x7 fine cube was chosen for cube integration. Probe isotropy errors were cancelled by measuring the SAR with normal and 90° turned probe orientations and averaging.
The dipole input power (forward power) was 250mW ± 3 %. The results are normalized to 1W input power.

5. SAR Measurement

Standard SAR-measurements were performed with the phantom according to the measurement conditions described in section 4. The results have been normalized to a dipole input power of 1W (forward power). The resulting averaged SAR-values are:

averaged over 1 cm^3 (1 g) of tissue:	**10.92 mW/g**
averaged over 10 cm^3 (10 g) of tissue:	**7.04 mW/g**

6. Dipole Impedance and Return Loss

The dipole was positioned at the flat phantom sections according to section 4 and the distance holder was in place during impedance measurements.

Feedpoint impedance at 835 MHz:	Re{Z} = **45.6 Ω**
	Im {Z} = **-6.5 Ω**
Return Loss at 835 MHz	**-21.8 dB**

7. Handling

Do not apply excessive force to the dipole arms, because they might bend. Bending of the dipole arms stresses the soldered connections near the feedpoint leading to a damage of the dipole.

8. Design

The dipole is made of standard semirigid coaxial cable. The center conductor of the feeding line is directly connected to the second arm of the dipole. The antenna is therefore short-circuited for DC-signals.

9. Power Test

After long term use with 100W radiated power, only a slight warming of the dipole near the feedpoint can be measured.

DASY3

Dipole Validation Kit

Type: D1900V2

Serial: 511

Manufactured: October 20, 1999
Calibrated: February 13, 2001

1. Measurement Conditions

The measurements were performed in the flat section of the new generic twin phantom filled with head simulating solution of the following electrical parameters at 1900 MHz:

Relative permitivity	**39.2**	± 5%
Conductivity	**1.47 mho/m**	± 10%

The DASY3 System (Software version 3.1c) with a dosimetric E-field probe ET3DV6 (SN:1507, conversion factor 5.57 at 1800 MHz) was used for the measurements.

The dipole feedpoint was positioned below the center marking and oriented parallel to the body axis (the long side of the phantom). The standard measuring distance was 10mm from dipole center to the solution surface. The included distance holder was used during measurements for accurate distance positioning.

The coarse grid with a grid spacing of 15mm was aligned with the dipole. The 5x5x7 fine cube was chosen for cube integration. Probe isotropy errors were cancelled by measuring the SAR with normal and 90° turned probe orientations and averaging.
The dipole input power (forward power) was 250mW ± 3 %. The results are normalized to 1W input power.

2. SAR Measurement

Standard SAR-measurements were performed with the head phantom according to the measurement conditions described in section 1. The results (see figure) have been normalized to a dipole input power of 1W (forward power). The resulting averaged SAR-values are:

averaged over 1 cm^3 (1 g) of tissue:	**42.8 mW/g**
averaged over 10 cm^3 (10 g) of tissue:	**21.9 mW/g**

Note: If the liquid parameters for validation are slightly different from the ones used for initial calibration, the SAR-values will be different as well. The estimated sensitivities of SAR-values and penetration depths to the liquid parameters are listed in the DASY Application Note 4: 'SAR Sensitivities'.

3. Dipole impedance and return loss

The impedance was measured at the SMA-connector with a network analyzer and numerically transformed to the dipole feedpoint. The transformation parameters from the SMA-connector to the dipole feedpoint are:

Electrical delay:	**1.205 ns**	(one direction)
Transmission factor:	**0.983**	(voltage transmission, one direction)

The dipole was positioned at the flat phantom sections according to section 1 and the distance holder was in place during impedance measurements.

Feedpoint impedance at 1900 MHz:	Re{Z} = **50.1 Ω**
	Im {Z} = **-1.5 Ω**
Return Loss at 1900 MHz	**- 34.9 dB**

4. Measurement Conditions

The measurements were performed in the flat section of the new generic twin phantom filled with muscle simulating solution of the following electrical parameters at 1900 MHz:

Relative permitivity	**53.5**	± 5%
Conductivity	**1.46 mho/m**	± 10%

The DASY3 System (Software version 3.1c) with a dosimetric E-field probe ET3DV6 (SN:1507, conversion factor 4.85 at 1800 MHz) was used for the measurements.

The dipole feedpoint was positioned below the center marking and oriented parallel to the body axis (the long side of the phantom). The standard measuring distance was 10mm from dipole center to the solution surface. The included distance holder was used during measurements for accurate distance positioning.

The coarse grid with a grid spacing of 15mm was aligned with the dipole. The 5x5x7 fine cube was chosen for cube integration. Probe isotropy errors were cancelled by measuring the SAR with normal and 90° turned probe orientations and averaging.
The dipole input power (forward power) was 250mW ± 3 %. The results are normalized to 1W input power.

6. SAR Measurement

Standard SAR-measurements were performed with the head phantom according to the measurement conditions described in section 1. The results (see figure) have been normalized to a dipole input power of 1W (forward power). The resulting averaged SAR-values are:

averaged over 1 cm^3 (1 g) of tissue:	**42.4 mW/g**
averaged over 10 cm^3 (10 g) of tissue:	**22.0 mW/g**

Note: If the liquid parameters for validation are slightly different from the ones used for initial calibration, the SAR-values will be different as well.

7. Dipole impedance and return loss

The impedance was measured at the SMA-connector with a network analyzer and numerically transformed to the dipole feedpoint. The transformation parameters from the SMA-connector to the dipole feedpoint are:

Electrical delay:	**1.205 ns**	(one direction)
Transmission factor:	**0.983**	(voltage transmission, one direction)

The dipole was positioned at the flat phantom sections according to section 1 and the distance holder was in place during impedance measurements.

Feedpoint impedance at 1900 MHz:	Re{Z} = **45.3 Ω**
	Im {Z} = **-1.0 Ω**
Return Loss at 1900 MHz	**- 25.6 dB**

8. Handling

The dipole is made of standard semirigid coaxial cable. The center conductor of the feeding line is directly connected to the second arm of the dipole. The antenna is therefore short-circuited for DC-signals.

Do not apply excessive force to the dipole arms, because they might bend. If the dipole arms have to be bent back, take care to release stress to the soldered connections near the feedpoint; they might come off.

After prolonged use with 40W radiated power, only a slight warming of the dipole near the feedpoint can be measured.
