## 1.7 TEST METHODOLOGY

All measurements contained in this report were conducted with ANSI C63.4-2009, American National Standard for Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the range of 9 kHz to 40 GHz.

For conducted (if applicable) and radiated emissions the equipment under test (EUT) was configured to measure its highest possible emission level. This level was based on the maximized cable configuration from exploratory testing per ANSI C63.4-2009. The test modes were adapted according to the Operating Instructions provided by the manufacturer/client.

### 1.8.1 FCC – Registration No.: US5296

TUV SUD America Inc. (San Diego), is an accredited test facility with the site description report on file and has met all the requirements specified in §2.498 of the FCC rules. The acceptance letter from the FCC is maintained in our files and the Registration is US5296.

### 1.8.2 Industry Canada (IC) Registration No.: 3067A

The 10m Semi-anechoic chamber of TUV SUD America Inc. (San Diego), has been registered by Certification and Engineering Bureau of Industry Canada for radio equipment testing with Registration No. 3067A.

## 1.9 SAMPLE CALCULATIONS

### 1.9.1 CDMA Emission Designator

Emission Designator = 1M30F9W

F = Frequency Modulation

9= Composite Digital Info

W = Combination (Audio/Data)

### 1.9.2 Spurious Radiated Emission (below 1GHz)

Measuring equipment raw measurement (dB $\mu$ V/m) @ 30 MHz			24.4
Correction Factor (dB)	Asset# 1066 (cable)	0.3	-12.6
	Asset# 1172 (cable)	0.3	
	Asset# 1016 (preamplifier)	-30.7	
	Asset# 1175(cable)	0.3	
	Asset# 1002 (antenna)	17.2	
Reported QuasiPeak Final Measurement (dB $\mu$ V/m) @ 30MHz			11.8

### 1.9.3 Spurious Radiated Emission – Substitution Method

Example = 84dB $\mu$ V/m @ 1413 MHz (numerical sample only)

The field strength reading of 84dB $\mu$ V/m @ 1413 MHz (2<sup>nd</sup> Harmonic of 706.5 MHz) is the maximized measurement when the EUT is on the turntable measured at 3 meters. The gain of the substituted antenna is 7.8dBi while the transmit cable loss is 1.0 dB (cable between signal generator and the substituted antenna). The signal generator level is adjusted until the 84dB $\mu$ V/m level at the receiving end is replicated (identical test setup, i.e. same antenna, cable/s and preamp). If the adjusted signal generator level is -18dBm, then we have the following for both EIRP and ERP as required:

$$\begin{aligned}
 P_{\text{EIRP}} &= -18 \text{ dBm} + 7.8 \text{ dBi} - 1 \text{ dB} \\
 &= 11.2 \text{ dBm} \\
 P_{\text{ERP}} &= P_{\text{EIRP}} - 2.15 \text{ dB} \\
 &= 11.2 \text{ dBm} - 2.15 \text{ dB} \\
 &= 9.05 \text{ dBm}
 \end{aligned}$$

### 2.8.6 Environmental Conditions

Ambient Temperature	23.1°C
Relative Humidity	49.0%
ATM Pressure	99.0 kPa

### 2.8.7 Additional Observations

- This is a conducted test. The EUT was operated at 13.5VDC nominal voltage and was placed in the temperature chamber for this evaluation. The EUT was controlled by a CMW500 and the maximum frequency error was monitored through a Spectrum Analyzer using marker frequency count function. The results are compared to the CMW500 carrier frequency error TX Measurement application.

- The Temperature was reduced to -30°C and allowed to sit for 1 hour to allow the equipment and chamber temperature to stabilize. The measurements on both cellular and PCS channels were then performed. The temperature was then increased by 10°C steps and allowed to settle before taking the next set of measurements.
- Voltage variation was also performed at 85% and 115% of the nominal voltage.
- Only worst case configuration presented. See Section 1.4.4 of this test report for details.
- For PCS measurements, the maximum frequency deviation was verified against the frequency band edges using the EBW data. Sample calculation:

*CDMA 2000 PCS High Channel worst case frequency error:* 13.76 Hz  
*Worst case EBW (-26dB) of CDMA 2000 PCS:* 1.616 MHz  
*Edge of fundamental emission (1908.75+(1.616/2)) :* 1909.558 MHz  
*Max. fundamental frequency error (1909.558 + 0.00001376):* 1909.558014 MHz  
*EUT complies. 1909.558014 MHZ < 1910 MHZ (edge of authorized band)*

## 2.10 POWER LINE CONDUCTED EMISSIONS

### 2.10.1 Specification Reference

RSS-Gen 7.2.4

### 2.10.2 Standard Applicable

Except when the requirements applicable to a given device state otherwise, for any radio apparatus equipped to operate from the public utility AC power supply, either directly or indirectly (such as with a battery charger), the radio frequency voltage of emissions conducted back onto the AC power lines in the frequency range of 0.15 MHz to 30 MHz shall not exceed the limits shown in the table below. The more stringent limit applies at the frequency range boundaries.

The conducted emissions shall be measured with a 50 ohm/50 microhenry line impedance stabilization network (LISN).

Frequency of emission (MHz)	Conducted limit (dB $\mu$ V)	
	Quasi-peak	Average
0.15–0.5	66 to 56*	56 to 46*
0.5–5	56	46
5–30	60	50

\*Decreases with the logarithm of the frequency.

### 2.10.3 Equipment Under Test and Modification State

Not applicable. EUT is not designed to operate from the public utility AC power supply.
